Analysis 01.51. Comparison 01 Active intervention versus control, Outcome 51 Appointment reminder (appointment interventions) (outcome: lost to follow up at clinic)
Interventions used to improve control of blood pressure in patients with hypertension (Review)

Date of most recent substantive amendment: 16 February 2006

**ABSTRACT**

**Background**
It is well recognized that patients with high blood pressure (hypertension) in the community frequently fail to meet treatment goals - a condition labeled as “uncontrolled” hypertension. The optimal way in which to organize and deliver care to patients who have hypertension so that they reach treatment goals has not been clearly identified.

**Objectives**
To determine the effectiveness of interventions to improve control of blood pressure in patients with hypertension. To evaluate the effectiveness of reminders on improving the follow-up of patients with hypertension.

**Search strategy**
All-language search of all articles (any year) in the Cochrane Controlled Trials Register (CCTR), Medline and Embase from June 2000.

**Selection criteria**
Randomized controlled trials (RCTs) of patients with hypertension that evaluated the following interventions:
(1) self-monitoring
(2) educational interventions directed to the patient
(3) educational interventions directed to the health professional
(4) health professional (nurse or pharmacist) led care
(5) organisational interventions that aimed to improve the delivery of care
(6) appointment reminder systems

Outcomes assessed were:
(1) mean systolic and diastolic blood pressure
(2) control of blood pressure
(3) proportion of patients followed up at clinic

**Data collection and analysis**
Two authors extracted data independently and in duplicate and assessed each study according to the criteria outlined by the Cochrane Collaboration Handbook.

**Main results**
56 RCTs met our inclusion criteria. The methodological quality of included studies was variable. An organized system of regular review allied to vigorous antihypertensive drug therapy was shown to reduce blood pressure (weighted mean difference -8.2/-4.2 mmHg, -11.7/-6.5 mmHg, -10.6/-7.6 mmHg for 3 strata of entry blood pressure) and all-cause mortality at five years follow-up (6.4% versus 7.8%, difference 1.4%) in a single large RCT - the Hypertension Detection and Follow-Up study. Other interventions had variable effects. Self-monitoring was associated with moderate net reduction in diastolic blood pressure (weighted mean difference (WMD): -2.0 mmHg, 95%CI: -2.7 to -1.4 mmHg, respectively. Appointment reminders increased the proportion of individuals who attended
for follow-up. RCTs of educational interventions directed at patients or health professionals were heterogeneous but appeared unlikely to be associated with large net reductions in blood pressure by themselves. Health professional (nurse or pharmacist) led care may be a promising way of delivering care, with the majority of RCTs being associated with improved blood pressure control, but requires further evaluation.

**Authors’ conclusions**

Family practices and community-based clinics need to have an organized system of regular follow-up and review of their hypertensive patients. Antihypertensive drug therapy should be implemented by means of a vigorous stepped care approach when patients do not reach target blood pressure levels.

### Plain Language Summary

There is a paucity of evidence as to how care for hypertensive patients should be organized and delivered in the community to help improve blood pressure control. This review aimed to determine the effectiveness of interventions whose objective was to improve follow-up and control of blood pressure in patients taking blood pressure lowering drugs. We included studies that had as population of interest adult patients with essential hypertension in an ambulatory setting. The interventions included all those that aimed to improve blood pressure control. The outcomes assessed were mean systolic and diastolic blood pressure, control of blood pressure and the proportion of patients followed up at clinic.

Fifty six randomised controlled trials met our inclusion criteria. The range of interventions used included (1) self-monitoring, (2) educational interventions directed to the patient, (3) educational interventions directed to the health professional, (4) health professional (nurse or pharmacist) led care, (5) organizational interventions that aimed to improve the delivery of care, (6) appointment reminder systems. The trials showed a wide variety of methodological quality, part of which may be attributed to poor reporting. An organized system of regular review allied to vigorous antihypertensive drug therapy was shown to reduce blood pressure and all-cause mortality in a single large RCT— the Hypertension Detection and Follow-Up study. Other interventions had variable effects. Self-monitoring was associated with moderate net reductions in diastolic blood pressure (weighted mean difference (WMD): -2.0 mmHg, 95% confidence interval (CI): -2.7 to -1.4 mmHg. Appointment reminders increased the proportion of individuals who attended for follow-up (absolute difference 16%, but this pooled result should be treated with caution because of the heterogeneous results from individual RCTs). Trials of educational interventions directed at patients or health professionals were heterogeneous but appeared unlikely to be associated with large net reductions in blood pressure by themselves. Health professional (nurse or pharmacist) led care appears to be a promising way of delivering care but requires further evaluation.

We conclude that an organized system of registration, recall and regular review allied to a vigorous stepped care approach to antihypertensive drug treatment appears the most likely way to improve the control of high blood pressure. Health professional (nurse or pharmacist) led care requires further evaluation. Education alone, either to health professionals or patients, does not appear to be associated with large net reductions in blood pressure.

### Background

High blood pressure (hypertension) is an important public health problem. Evidence from randomized trials has shown that effective drug treatment reduces the risk of cardiovascular morbidity and mortality (Collins 1994; Gueyffier 1999). However, there is ongoing concern that the benefits demonstrated in randomized trials of antihypertensive drug treatment are not implemented in everyday clinical practice (Burnier 2002). Community-based studies throughout the world show that blood pressure goals are achieved in only 25–40% of the patients who take antihypertensive drug treatment (Burnier 2002; Hyman 2001; Chobanian 2001; Smith 1990), a situation that has remained unchanged for the last 30 years (Wilber 1972).

The quality of care patients with hypertension receive from health professionals has a clear impact on their risk of suffering a cardiovascular event. Observational studies in the UK have shown that inadequate control of blood pressure is associated with a significant risk of stroke (Du 1997; Payne 1993). In terms of the process of care that hypertensive patients receive, characteristics of both the patient, health professional and the healthcare system in which they are given their medical care have been implicated in poor blood pressure control. Lack of adherence to medication and not having a primary care physician were associated with poor blood pressure control in a US study (Shea 1992). More recent studies have shown that frequent contact with health care pro-
professionals does not guarantee better blood pressure control unless there is more vigorous use of antihypertensive drugs (Hyman 2001; Berlowitz 1998), and that individual practitioners vary substantially in their clinical performance when managing hypertension in the community (Frijling 2001). These observations have led some commentators to suggest that poor control of blood pressure in the community may be due to ineffective management and inadequate practice organisation, described jointly as “clinical inertia” (Phillips 2001).

Whilst there is a strong evidence-base for the benefits of antihypertensive drug therapy (Collins 1994; Blood 2000; Staessen 2001), there is little clear evidence as to how care for hypertensive patients should be organized and delivered in the community to help improve blood pressure control. This systematic review aims to update and build upon a previous review (Ebrahim 1998), to summarize the evidence from randomized controlled trials that evaluate different models of care that have been used to improve the control and follow-up of patients with hypertension.

**OBJECTIVES**

The objectives of this review are to:

1. Evaluate which models of care are effective in improving “control” of high blood pressure;
2. Evaluate the effectiveness of reminders on improving the follow-up of patients with hypertension.

**CRITERIA FOR CONSIDERING STUDIES FOR THIS REVIEW**

**Types of studies**

Randomized trials of interventions that have sought to evaluate different models of care for patients with hypertension with the overall aim of improving blood pressure control or follow-up care of patients. Included studies had to be RCTs with a contemporaneous control group where patient care in the intervention group(s) was compared with either no intervention or usual care. We excluded studies using interventions not intended to increase blood pressure control by organisational means, particularly drug trials and trials of non-pharmacological treatment.

**Types of participants**

The population of interest was composed of adult patients (aged 18 years or over) with essential hypertension (treated or not currently treated with blood pressure lowering drugs) in a primary care, outpatient or community setting.

**Types of intervention**

The interventions were aimed at improving control of blood pressure or clinic attendance and were classified as:

1. self-monitoring
2. educational interventions directed to the patient
3. educational interventions directed to the health professional
4. health professional (nurse or pharmacist) led care
5. organisational interventions that aimed to improve the delivery of care
6. appointment reminder systems

**Types of outcome measures**

Studies were included if they reported:

1. mean systolic blood pressure (mean SBP) and/or mean diastolic blood pressure (mean DBP)
2. control of blood pressure (blood pressure threshold that determines “control” being pre-specified or defined by each randomized trial’s investigators)
3. proportion of patients followed-up at clinic

**SEARCH METHODS FOR IDENTIFICATION OF STUDIES**

See: methods used in reviews.

We identified original RCTs by an all-language search of all articles in the Cochrane Central Register of Controlled Trials (CENTRAL), from The Cochrane Library issue 2, 2004; from MEDLINE January 2000 to July 2004; and EMBASE January 2000 to July 2004. We screened the references of all retrieved articles to identify additional publications and contacted experts in the field about other relevant trials or unpublished material.

METHODS OF THE REVIEW

Two of the authors (TF and KS) assessed lists of citations and abstracts independently. We were not masked with regard to authors or journal. Each reviewer indicated whether a citation was potentially relevant (i.e. appearing to meet the inclusion criteria), was clearly not relevant, or gave insufficient information to make a judgement. To be included a study had to meet all the inclusion criteria. We resolved differences by discussion and obtained reprints of all potentially relevant citations.

We (TF and either KS or SE) independently extracted data in duplicate on study design, methods, clinicians and patients, interventions, outcomes and potential sources of bias using a structured data collection form. We wrote to the corresponding authors of studies to request missing data, clarify study details and enquire about unpublished studies.

For assessment of study quality we collected data on randomization procedure, allocation concealment, blinding of participants, providers of care, outcome assessors and losses to follow-up (Clarke 2000).

We examined the effects on blood pressure between interventions at follow-up (systolic and diastolic blood pressure) according to the six pre-defined intervention categories. We compared and pooled the mean blood pressure differences from baseline to final follow-up in the intervention and control groups using the weighted mean difference approach (see Cochrane Heart Group website: http://www.epi.bris.ac.uk/cochrane/stats3.html). When only partial information about the variance was provided in RCT reports, we calculated variances using the method described by Follman (Follman 1992). We have taken account of the correlation of baseline and final blood pressure measurements by using empirical data from the Caerphilly dataset which examined the correlation between baseline and 5-year follow-up blood pressure measurements in 2000 men (r=0.568 for systolic and r=0.514 for diastolic blood pressure) (personal communication Margaret May, Department of Social Medicine, University of Bristol).
For blood pressure control and clinic attendance at follow-up statistical and clinical significance was evaluated by means of estimating odds ratios with 95% confidence intervals. Individual study definitions of control of blood pressure and attendance at clinic were used. For both continuous and categorical outcomes, we checked the meta-analyses for heterogeneity by visual inspection and by Cochran’s test. When heterogeneity is significant, the individual study results are presented to illustrate the magnitude of blood pressure reduction reported but no overall pooled results are presented. Pooled odds ratios and their 95% confidence intervals were calculated with The Cochrane Collaboration RevMan 4.1 software.

DESCRIPTION OF STUDIES

Fifty six randomized controlled trials met the inclusion criteria. Three randomised controlled trials had a factorial design and are included twice under separate intervention headings - Pierce (self-monitoring and education-patient) (Pierce 1984), Sackett (education-patient and organisation of care) (Sackett 1975), and Dickinson (education-health professional and organisation of care) (Dickinson 1981). A further RCT was a three armed study of patient education, home monitoring from a family member actively participating in their care and a usual care arm (Earp 1982).

METHODOLOGICAL QUALITY

The reported methodological quality of included studies was generally poor to moderate. Nineteen randomised controlled trials (32%) stated the randomization process, whilst only six (10%) had adequate allocation concealment. In 11 studies (19%) the outcome assessors were blind to the treatment allocation. Losses to follow-up of greater than 20% or more occurred in 12 (20%) of studies.

For a detailed summary of each of the 56 included RCTs see Table 01.

RESULTS

In the ten RCTs that reported on differences in mean SBP (Carnahan 1975; Soghikian 1992; Friedman 1996; Bailey 1998; Mehos 2000; Vetter 2000; Rogers 2001; Artinian 2001; Midanik 1991; Rudd 2004), self-monitoring was associated with a significant (mean difference -10 to +5mmHg). Pooled data from twelve RCTs on difference in mean DBP (Carnahan 1975; Soghikian 1992; Fried-
Key findings from this review

The main finding from this systematic review are to a large extent dominated by the findings from the largest RCT, the HDFP study (Hypertension 1979; Hypertension 1979a; Hypertension 1982). Though partly intended as a trial to assess the value of systematic identification of hypertensive patients (Davis 2001), the key ingredients of how patients with established hypertension and taking antihypertensive drug treatment were managed-free care, registration, recall and regular review in tandem with a rigorous stepped care approach to antihypertensive drug treatment - should be emphasized as this multi-faceted intervention was effective in terms of reaching blood pressure goals and reducing all-cause mortality. It is interesting to note that a two-year post trial surveillance study showed that blood pressure control was attenuated when the stepped-care arm of the study was discontinued. This lack of control was associated with a decline in the use of antihypertensive medication (Hypertension 1986).

Other interventions assessed in this systematic review did not produce clear results. None of the interventions were associated with large, clinically important, reductions in either systolic or diastolic pressure, see MetaView. Self-monitoring was associated with a significant decline in diastolic blood pressure and further evaluation in larger RCTs is warranted. Education alone, directed either to patients or health professionals appears unlikely to influence control of blood pressure as a single intervention, as results were highly heterogeneous or of marginal clinical importance. Use of health care professionals such as nurses and pharmacists, though producing significantly heterogeneous results, did have mainly favourable effects, and merit further definitive evaluation in larger RCTs. Lastly, reminders (postal or computer-based) were associated with an improvement in the follow up of patients with hypertension in all RCTs aside from one small study. This finding is consistent with the organisational structure of the HDFP study and re-iterates the importance of systematic recall systems when organising care for hypertensive patients.

Context of other studies

There are elements identified from this review that appear to be associated with improved blood pressure control and are consistent with findings from observational studies and previous systematic reviews. In a large community-based study, patients who received intensive antihypertensive drug therapy were significantly more likely to have reduced systolic blood pressure of 6.3 mmHg compared to an increase of 4.8 mmHg in those who received less intensive antihypertensive drug therapy (Berlowitz 1998). A more recent observational study showed that antihypertensive drug therapy was initiated or changed in only 38% of episodes of care, despite documented uncontrolled hypertension for at least six months (Davis 2001; Davis 2001; Davis 2001; Oliveria 2002). Lack of practice organisation is associated with a failure to achieve treatment surrogate goals in hypertension, diabetes and secondary prevention of coronary heart disease (Phillips 2001). A recent systematic review of self-monitoring also produced similar findings of modest but potentially important benefit (Cappuccio 2004).

We have found substantially more RCT evidence in terms of hypertension management than a recent systematic review that examined interventions used in disease management programmes for patients with chronic illness (Weingarten 2002). In this re-
view, eight hypertension-related RCTs were cited which provided some evidence of benefit in terms of education directed at the patient and provider (health professional) (Weingarten 2002). In this systematic review of 56 RCTs, the subset of RCTs where the intervention was directed at the patient (n=16) or physician (n=9) does not support this finding, showing no clinically important evidence for patient or health professional education as an effective implementation strategy in the management of hypertension.

**Study limitations**

There are several shortcomings that need to be highlighted in this systematic review. The HDFP study was designed as an intervention that would identify newly diagnosed hypertensive patients and then start or modify antihypertensive treatment in those with untreated as well as uncontrolled hypertension (Davis 2001). A consequence of this study design is that a differential number of people were receiving antihypertensive drug treatment in the two arms, percentage of patients taking antihypertensive medication - higher for stepped care 81.2%, compared to referred care 64.2% at follow-up in year 5 (see details on included studies). So though it appears that the systematic follow-up and stepped care approach in HDFP is an important element in effective clinical care and prompts rigorous antihypertensive drug treatment, it is not possible to distinguish between the independent effect of these interventions on blood pressure control. Several other RCTs included both treated and untreated hypertensive patients and had differential rates of antihypertensive drug prescribing (Vetter 2000; Midanik 1991; Rudd 2004; Ornstein 2004), with rates of prescribing at higher levels in the intervention arm at follow up. Secondly, many RCTs contained multi-faceted interventions that did not fit into a single intervention category. For example several RCTs that were included under categories of patient education, physician education, health professional led care and organisation of care also incorporated some form of reminder intervention such as postal reminders or computer generated feedback (Dickinson 1981; Hamilton 1993; Hawkins 1979; Takala 1979; Takala 1983). Consequently, it has been difficult to attribute how far single elements that make up complex interventions exert their independent effect on blood pressure control. In terms of self-monitoring, it is well established that "office" blood pressure readings are around 10/5mmHg higher when compared to ambulatory or self-monitored readings (Staessen 1997; Staessen 2004; Williams 2004). Several of the RCTs did not make any recommendations about the need for adjustment of target blood pressure readings when self-monitoring was the intervention being assessed, nor did they appear to anticipate lower blood pressure readings in the self-monitoring group (Bailey 1998; Johnson 1978; Pierce 1984). This may have attenuated the impact of self-monitoring on blood pressure control because of failure to intensify treatment. Poor adherence to therapy is thought to be associated with poor control of blood pressure (Shea 1992). Only a few trials examined the relation between adherence to medication and control of blood pressure (Haynes 1976; Johnson 1978; Sackett 1975). Future studies will need to be designed to assess the relationship between poor adherence and poor response to antihypertensive drugs in patients with good adherence. Lastly, not all RCTs reported on the outcomes of blood pressure achieved or blood pressure control. This has meant that the relevant a priori outcomes have not been reported for all included RCTs, and pooling of data from all RCTs has not been possible.

**Authors’ conclusions**

**Implications for practice**

Despite these limitations important messages emerge from this systematic review. Effective delivery of hypertensive care requires a systematic approach in the community, incorporating regular review of patients and a willingness to intensify antihypertensive drug treatment, usually by adding additional classes of antihypertensive drugs, when blood pressure goals are not being met (Hypertension 1975; Hypertension 1979a; Hypertension 1986b; Davis 2001). This approach of intensive drug therapy and "tight" control of blood pressure has been demonstrated to be possible in clinical trials in hypertensive and diabetic patients alike (Hansson 1999; UK PDS 1998). There are reports of successful systematic care of hypertensive patients in the community over a 20 year period (Hart 1991), but the challenge is to translate these findings into usual clinical care.

**Implications for research**

In terms of future studies, careful preliminary work is needed when developing and testing complex interventions and thought needs to be given as to how their individual and combined effects are measured (Campbell 2000). Aside from definitive RCTs examining the effects of self-monitoring and allied health professional led care (pharmacist and nurses), there is also a paucity of evidence in terms of computer-based clinical decision support systems (CDSSs) in hypertension and how adherence-enhancing strategies influence subsequent blood pressure control (Ebrahim 1998). HDFP was a well-funded study with substantial staffing resources. This meant that the "stepped care" intervention was provided by a highly motivated workforce. An economic evaluation of delivering organised care to hypertensive patients should accompany future studies. Lastly, none of the included RCTs attempted to manage hypertension in the context of overall cardiovascular risk. Future studies need to be congruent with hypertension guidelines that recommend treatment and control of blood pressure in combination with multi-factorial risk reduction (Ramsay 1999).

**Conclusions**

Effective delivery of hypertension care in the community requires a rigorous approach in terms of identification, follow-up and treatment with antihypertensive drugs. This systematic review shows that such an approach is likely to translate into reductions in car-
diovascular mortality and morbidity (Hypertension 1979; Hypertension 1979a; Hypertension 1986; Davis 2001). Supplementary and alternative models of care, including self-monitoring of blood pressure by patients, blood pressure management by allied health care professionals and CDSSs require further development and evaluation. Educational interventions directed to either patients or health professionals alone are unlikely to produce clinically important reductions in either systolic or diastolic blood pressure.

</thead>
<tbody>
<tr>
<td>Methods</td>
<td>Parallel, individuals based in general practitioner surgeries, Australia</td>
</tr>
<tr>
<td>Participants</td>
<td>Patients who were about to start BP lowering treatment who did not practice self-measurement, &lt;7% previously untreated, mean age 53.5 years.</td>
</tr>
<tr>
<td>Interventions</td>
<td>(1) Self monitoring- use of an OMRON HEM706 monitor. Asked to record BP twice daily for 8 weeks (2) Usual care- no self recording</td>
</tr>
<tr>
<td>Outcomes</td>
<td>(1) Blood pressure control- significantly worse (E) 148/89mmHg versus (C) 142/89. (2) Process of medical care-more vigorous in (C) group in terms of increase, addition of medication (3) Compliance (pill count) (E) 88% versus (C) 94% NS Duration of FU 8 weeks</td>
</tr>
<tr>
<td>Notes</td>
<td>23% patients were not interested in future self-measurement Outcome assessment: 24 hour ambulatory monitoring Physicians not instructed to achieve a treatment goal or protocol Significant disagreement between self monitoring and office measurement found by 19% physicians and 16% patients. In (E) group negative finding most likely due to the fact that physicians were less likely to alter drug regimen when self-measurement readings were lower than office BP measurement. Finding most likely to due different responses to process of care no protocol concerning treatment intensification was provided in this RCT. No adjustment to the lower self monitor readings were made and no intensification was associated with the intervention</td>
</tr>
<tr>

</tr>
<tr>
<td>Participants</td>
<td>Physicians nurse-practitioners (numbers not stated). Patients (n= 115) with sustained hypertension and/or diagnosis of hypertension and placed on therapy, &lt;2 repeat BP measurements after initial visit. 49% female, mean age 43 years (42% older than 45 years), 17% black</td>
</tr>
</tbody>
</table>

Outcomes: (1) First follow up visit to walk-in clinic or a continuity medicine clinic- no difference at 6 months (E) 45/53, 85% versus (C) 48/54, 89% Duration of FU 6 months

Notes: No blood pressure data collected at outcome

Allocation concealment: B – Unclear
Characteristics of included studies (Continued)

Mean initial BP 150/102mmHg, 7% with history of hypertension, 4% with history of cardiovascular disease, 15% with family history of hypertension, 34% diagnosed obese.

Interventions

1. Computer reminder to GP- automated surveillance system utilizing computer-based medical record system, generated automatic reminder to GP to check BP of patients. "No attempt was made to monitor the quality of care as to the degree of BP control".
2. Usual care.

Outcomes

1. Evaluate extent BP FU was attempted or achieved, (E) 62/63 (98%) versus (C) 24/52 (46%).
2. Repeat BP recorded (E) 44/63 (70%) versus (C) 27/52 (52%).
3. Degree of DBP control achieved (DBP <100mmHg) (E) 44/63 (70%) versus (C) 27/52 (52%).

Duration of FU 24 months.

Notes

Intervention improved follow up of patients and in those who were followed up DBP was significantly improved.
Stratified according to age (<45) and DBP (<100mmHg).

Allocation concealment B – Unclear

Study Billault 1995

Methods Parallel, individuals in a single outpatient clinic, Paris, France.

Participants Individuals who attended hypertension clinic, no entry SBP/DBP defined, 88% (C) 83% (E) on BP lowering drugs. 63% male.

Interventions

1. Booklet with personalised standardised medical information explained to patient and their family doctor. Ten items included on the basis of usefulness of managing hypertension. Patients asked to complete with family doctor and mail carbon copy to outpatient clinic for entry into computerised record.
2. Usual care Patients in both groups encouraged to visit family doctor 1-3 times per trimester according to severity of hypertension.

Outcomes

1. Process of care in terms of use of services. (E) 145.1/88.2mmHg versus (C) 146.2/86.8; no difference between groups
2. SBP/DBP- (E) 145.1/88.2mmHg versus (C) 146.2/86.8; no difference between groups.
3. Other cardiovascular risk factors (smoking, exercise, body weight- no difference between groups.

Duration of FU 1 year

Notes 44/82 (54%) of intervention group who were followed up completed personal medical record.

Allocation concealment B – Unclear

Study Bloom 1979

Methods Parallel, individuals based after a work-site screening programme US.

Participants Patients with elevated blood pressure 140/90mmHg.
Average age 40, white, male 82%, well educated 60% with a master's degree or higher.

Interventions

1. Educational material about hypertension, reinforced by a hypertension counsellor one week later, designed to improve appointment keeping and knowledge.
2. No educational material or counsellor follow up.

Outcomes

1. Number seeking medical care/appointment- significantly improved 15/27 (E- 55.5%), 7/27 (C- 25.9%)
2. Knowledge about hypertension- increased in (E) 3.22 versus (C) 2.26.

Duration of FU 3 months

Notes RCT concerned with initial follow up of patients identified as having sustained hypertension after screening programme.

Allocation concealment B – Unclear

Study Bogden 1998

Methods Parallel, individuals in a single OPD clinic in US.
Characteristics of included studies (Continued)

Participants
Patients with increased blood pressure, either:
150 or 95mmHg
140 or 90mmHg with CVS risk factors or target organ damage
Mean age 55 ±13, 25% mixed Hawaiian ancestry, 57% high school graduates, 87% health insurance

Interventions
(1) Pharmacist interacted with physicians and patients:
Patients:
"Go through medication history"
"Answered questions"
"Encouraged compliance"
Physicians:
"Reviewed laboratory data with doctors"
"Attached "recommendations" about blood pressure treatment"
Control: usual medical care without pharmacist involvement

Outcomes
(1) % patients with controlled BP (<140 and <90mmHg) - improved 27/49 (E) 9/46 (C) p<0.001
(2) Mean reduction in SBP/DBP at follow up - improved (E) 132/85mmHg versus (C) 145/92mmHg p<0.01
(3) Mean medication cost decreased $6.8 (E) increased $6.5 (C)
Duration of FU 16 months

Notes
No contamination between doctors
Intervention superior to usual care
Process of care in intervention arm. Pharmacist made 162 recommendations to doctors:
10 new (additional) medication to be started
34 medication dose increase
12 stop medication
5 reduce medication due to side effects
16 renew medication at existing dosage
52 switch to a cheaper drug
20 newer more effective drug

Allocation concealment B – Unclear

Study Brook 1983
Methods Cluster RCT, families unit of randomisation
Participants 2005 Families living in six US cities (47% men, 18% non white, mean age 33.4, range 14-61) Results are reported for subset of hypertensive subjects, 24.7% (n=294) full health insurance, 24.5% (n=562) partial health insurance.

Interventions
(1) Full health insurance-(2) Partial health insurance (three groups at different levels of re-imbursement:(a) Individual - 95% OPD to ceiling of $150, all inpatient(b) Intermediate- 25-50% both OPD and inpatient up to $1000(c) Catastrophic- 95% both OPD and inpatient up to $1000

Outcomes
(1) Mean DBP- improved by -1.9mmHg(2) Mean SBP- improved by -1.8mmHg(3) General health(4) Health habits(5) Risk of dyingDuration of FU: 3 years

Notes SBP/DBP reported but baseline DBP lower than follow up (see tables 3 and 5 in original report). Subsequent report suggested lower SBP/DBP at follow up adjusted for blood pressure at baseline (see table 2 and text), high losses to FU/No details on process of BP care, but free care increased physician contacts and better lifestyle changes Subgroup analysis: Low-income people with high BP had greater improvement than high-income--3.5mmHg (low income) versus 1.1mmHg (high-income)

Allocation concealment B – Unclear

Study Bulpitt 1976
Methods Parallel, individuals based in 3 hospital hypertension clinics in UK

Interventions used to improve control of blood pressure in patients with hypertension (Review)

Interventions used to improve control of blood pressure in patients with hypertension (Review)
### Characteristics of included studies (Continued)

| Participants | Hospital physicians  
| (number not stated)  
| 116 patients, 90.5% female, mean age 52 years, all black  
| unselected, consecutive referrals to clinics during 6-month period. Characteristics:  
| (1) Mean of 3 separate pretreatment BP measurements >140/95 mmHg  
| (2) Three return visits while on treatment  
| (3) BP medication taken as prescribed  
| Interventions | (1) Computer-generated treatment recommendations by algorithm; generated drug type and dose recommendations to physician  
| (2) Usual physician care  
| Outcomes | (1) Blood pressure - reported in three strata of DBP, <95, 95-105, >105 but no differences between (E) 152.5/99.6 mmHg versus (C) 148.7/96.5 mmHg  
| (2) Compliance- self report, no difference  
| (3) Drugs prescribed- patterns of drug use the same.  
| Notes | Difficult to interpret as trial reported on all outcomes by means of initial DBP strata.  
| Mean SBP/DBP was non significantly better in (C) versus (E).  
| Overall conclusion computer generated treatment (E) and usual care by physicians (C) was equivalent.  
| Allocation concealment | B – Unclear  

#### Cummings 1985

| Study Methods | Hypertensive patients attending in a single urban family practice  
| Participants | Patients, aged 19 to 96, mean age 60.62% female, 91% black, 11% newly diagnosed, 75% SBP <140 mmHg and DBP >90 mmHg  
| Interventions | (1) Appointment reminder- reminder card sent one week in advance of appointment and telephone patients who missed appointments to schedule new ones(2) Usual care  
| Outcomes | (1) Appointment keeping rate- appointments improved in (E- 87%) versus (C- 79%).(2) Dropouts from treatment- drop outs less at 4 months in experimental group (E- 87/486, 18%) versus (C- 150/487, 31%)(3) Blood pressure control- average SBP/DBP improved in experimental group(SBP-2 mmHg, p=0.18 and DBP -1 mmHg, p=0.75)(4) Proportion of patients with controlled hypertension (<140/90)- 31% (E) versus 25% (C)  
| Notes | Duration FU 8 months  
| Allocation concealment | B – Unclear  

#### Dickinson 1981

| Study Methods | Factorial, Cluster, RCT  
| Participants | Four clinical teams in Family Medicine Centre in USA, 4 faculty physicians37 residents. Each team received on of the interventions.250 Patients, 69.9% female, mean age 49.6 years, 70.4% white mean weight 78.9 kg, mean baseline BP 159/89 mmHg. Inclusion criteria:(1) Hypertensive patients visiting practice during 4-month baseline period(2) Elevated systolic or diastolic pressure at last baseline visit(3) At least one visit during 7-month intervention period  
| Interventions | (1) Computer-generated feedback-monthly feedback reports on individual patients for physician, containing identification, age, date of last visit and latest BP in those with uncontrolled hypertension (age 18-44 >/=140/90; 45-64 >/=150/95; age >/=64 >/=160/95) or overdue appointments  
| Notes | Duration FU 8 months  
| Allocation concealment | B – Unclear  

---

**Interventions used to improve control of blood pressure in patients with hypertension (Review)**

Copyright © 2006 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd
### Characteristics of included studies (Continued)

| Outcomes | 1) Follow up appointments increased in interventions-feedback 3.4, education 3.3, both 3.2, control 2.6 NS. (2) Knowledge significantly improved in physicians who received education only, feedback 76, education 84, both 78, control 74 (3) Blood pressure control- no difference - feedback 145/86mmHg, education 149/85mmHg, both 149/84mmHg, control 148/83 (4) % with controlled hypertension- non significant differences, feedback 65%, education 63%, both 57%, control 58% Duration of FU 7 months.

| Notes | Intervention randomised by, directed at physicians, analysis by patient. No account taken of clustering. Explains uneven patient numbers per arm of RCT

| Allocation concealment | B – Unclear

### Study: Earp 1982

**Methods:** Parallel Individuals

**Participants:** Hypertension, taking BP medication that had been initiated, altered or re-started. Based in outpatient hypertension clinic or family practice clinic, n=218, mean age 48, 59% female, 77% black

**Interventions:** (1) Home visits- over 18 months by nurse or pharmacist. Provided a "test of how effectively home-visiting health practitioners could motivate and/or reinforce positive health behaviours, including medication compliance" (2) Home visits plus involvement of "significant other"- involved daily/several times a week BP monitoring (3) Usual care

**Outcomes:** (1) Home visit group versus usual care; proportion of patients in each group with uncontrolled hypertension (DBP >/=95mmHg)- significant effect at year 2 (E) 21% versus (C) 42%, not significant at year 1 (E) 34% versus (C) 34%. (2) Home visit and involvement of significant other versus usual care; proportion of patients in each group with uncontrolled hypertension (DBP 95mmHg)- non significant effect at year 2 (E) 25% versus (C) 42%, not significant at year 1 (E) 39% versus (C) 34%. Duration of FU: 1 year

**Notes:** Large proportions lost to follow up at year 2, hence follow up at 1 year when pooling data. Mean number of BP medication taken declined in the two intervention group (1.7 to 1.5 Group 1 and 1.5 to 1.4 Group 2) but increased in control group (Group 3 1.6 to 1.8); between group differences non significant.

| Allocation concealment | B – Unclear

### Study: Evans 1986

**Methods:** Cluster- physicians stratified to solo or group practice and randomly allocated within strata

**Participants:** Canadian family physicians. Eligible patients, age 30 to 69 years, either DBP >90mmHg at one home visit and taking BP medication or no BP medication and DBP >90mmHg on 3 times at home visits

**Interventions:** (1) Mailed CME to physicians14 weekly installments of information, chart and fu appointment system to encourage detection and recall of patients (2) Usual care

**Outcomes:** (1) Blood pressure- (DBP <90mmHg, (E) 67% versus (C) 67%, non significant. (2) # visits for BP check-no difference(3) # patients told BP elevated- no difference(4) # patients on BP medication- no difference(5) Mean % compliance rate- no difference(6) % patients with controlled blood pressure- no difference Duration FU 1 year

**Notes:** Cluster RCT- BP data aggregated at cluster level. No difference found between intervention and usual care, 76% (E) and 79% (C) patients on BP medication.

| Allocation concealment | B – Unclear

Interventions used to improve control of blood pressure in patients with hypertension (Review)
Characteristics of included studies (Continued)

Participants
Under care of physician for hypertension on BP lowering drugs, SBP >/=160 mmHg or DBP >/= 90mmHg on average two readings. 90% white, 77% female, mean age 76 years

Interventions
(1) Home monitoring and telecommunication system
"Weekly automated home blood pressure recording.
"Telephone-linked computer system (TLC)- computer-based telecommunications system that converses with patients in their homes, patients contacted weekly. Provides advice concerning their blood pressure, understanding of BP lowering medication, adherence to medication, symptoms that might relate to side effects of therapy. Information directed to patient's physician
(2) Usual care

Outcomes
(1) Adherence to medication- improved by 18% (E) vs 12% (C), p=0.03.
(2) Mean change in SBP/DBP- no difference for SBP, (E) 158.5mmHg versus (C) 156.4mmHg, p=0.2; significant difference for DBP, (E) 80.9mmHg versus (C) 83.2mmHg, p=0.02;
(3) Cost effectiveness- most cost effective for non-adherent patients

Notes
Cost effectiveness measured all computer and telecommunication costs, facilities charges, supplies and support personnel for start-up and maintenance of the system. Cost effectiveness ratios were computed for medication adherence improvement and DBP decrease using regression analysis

Allocation concealment
B – Unclear

Study Garcia-Pena 2001
Methods Parallel, individuals, elderly (60) age-stratified sample recruited from 12 family medical centres, Mexico city, Mexico
Participants Hypertension, mean SBP 160 or both DBP 90 in untreated patients or treated hypertension patients Mean BP level 161.9/90.8 (C) 162.1/90.9 (E) average age 70.6 years

Interventions
(1) Nurse-based intervention
Nurses trained in aging and clinical aspects of hypertension including:
"Personal interviews
"Health behaviour change models
"Process of negotiation
"Ethical aspects of home visits
On each visit nurse did the following:
"Measured BP
"Discussed baseline health check and discussed lifestyle changes
"Guided patients in healthier lifestyle and negotiated specific targets
"Revised pharmacological treatment
"Adherence encouraged
Frequency of visits 2-4 weeks
(2) Usual care from institute’s clinic and mailed pamphlet about hypertension

Outcomes
(1) Blood pressure- mean change SBP 3.31 mmHg p=0.03, mean change DBP 3.67mmHg p<0.001
(2) Weight -1.1 kg significantly reduced
(3) Sodium excretion -5.8 ns
(4) Control BP <160/90mmHg improved 36.5% (E) versus 6.8% (C)
(5) Exercise- slow walking exercise increased (E) 9.1% versus decreased (C) 0.7%
(6) Not taking antihypertensive drugs (E) 15.9% versus (C) 26.9%
(7) Antihypertensive drug usage- increased in (E) change from baseline12.5% versus (C) 5.3%, difference 7.2% p=0.02

Duration of FU 6 months

Notes
Well conducted RCT. Nurse intervention aimed at both pharmacological and non-pharmacological management of hypertension. Had positive effect on mean SBP/DBP and BP control with increases in number

<tr>
<td>Methods</td>
<td>Factorial RCT, randomised by physician (n=111), analysed by patient (n=2583), San Francisco USA. Average of 23 patients per practice</td>
</tr>
<tr>
<td>Participants</td>
<td>Hypertensive patients using anti-hypertensive medication, had a DBP &gt;90mmHg at some stage of their care. Age range 20-80 years</td>
</tr>
<tr>
<td>Interventions</td>
<td>(1) Medical education- &quot;Individualised feedback on medical record information, detailed peer-review &quot;Syllabus material &quot;Educational session by means of telephone call with faculty expert discussing feedback reports and syllabus materials. (2) Behavioural education- &quot;Individualised feedback on patient survey summaries, detailed peer-review &quot;Syllabus material &quot;Educational session, telephone call with faculty expert discussing feedback reports and syllabus materials. (3) Both interventions (4) Neither intervention</td>
</tr>
<tr>
<td>Outcomes</td>
<td>(1) DBP- no difference between four groups either for mean DBP (85.17, 85.59, 85.16, 85.79 mmHg respectively) or for % with controlled DBP (68.65%, 66.78%, 67.93%, 68.25% respectively) at follow up. (2) Lifestyle outcomes- no difference apart from decreased BMI in behavioural group. (3) Health promotion advice given- more likely to be given advice re: medication regimen, side effects of drugs, sodium intake in behavioural group.</td>
</tr>
<tr>
<td>Notes</td>
<td>Negative RCT with regard to primary outcome of DBP. Caution required with interpretation of lifestyle and health promotion outcomes. Multiple comparisons. DBP reported but not usable because no baseline numbers randomised reported or standard deviations</td>

Characteristics of included studies (Continued)

Participants
Inclusion criteria: (1) Men and women age 30 to 69 years (2) Average home screening DBP 95mmHg (3) Confirmed follow up DBP 90mmHg
Exclusion criteria: (1) Terminally ill (2) Institutionalised 10,940 randomised, 54% male, 45% black Antihypertensive drugs taken at start of RCT: SC (26.3%), RC (25.7%)

Interventions
(1) Stepped care (SC), designed to provide rigorous, systematic, antihypertensive drug treatment by means of:
  "Free care- visits, drugs, investigations, transport
  "Emphasis placed on clinic attendance and compliance- pill counts used
  "Convenience- low waiting times, parmedical personnel, physician on call
  "Stepped drug treatment according to BP response
  "Patients seen at intervals determined by their clinical status, at least every 4 months, and generally every 2 months

(2) Referred care (RC): referred to their "primary sources of care, usually own physicians.

All SC (E) and RC (C) participants seen at home at years 1, 2, 4 and 5 for health history and BP measurement and at the clinic at years 2 and 5 for an examination. At each contact each RC participant was advised to visit a physician. If severe hypertension (DBP 115mmHg or end organ damage) special steps were taken to achieve contact with a physician.

Outcomes
(1) # (%) on antihypertensive medication- higher for SC 81.2%, compared to RC 64.2% by year 5.
(2) SBP/DBP level- lower for SC (130/84mmHg) vs RC (140/89) at 5 year FU
(3) % controlled blood pressure (HDFP goal)- improved SC versus RC.
(4) All cause mortality- significantly better 350/5485 (6.38%) vs 421/5455 (7.78%)

All outcomes apply across 3 strata of entry DBP. Most of BP reduction occurred by end of year 1

Duration FU 1 and 5 years (mortality)

Notes
Data reported in 3 strata of entry DBP
At one year 84.4% (SC) versus 59.1% (RC) taking antihypertensive medication
Step 1- 32.7% v 12.1%
Step 2- 23.6% v 16%
Step 3- 3.3% v 2.3%
Step 4- 2% v 2%
Total drug status known at 1 year, 82.4% SC v 82.8% RC

Intensity of BP medication in SC at 5 years: 42% taking single drug- step 1, 27% taking two drugs- step 2, 9% taking 3 drugs- step 3, 11% taking 4 or more drugs, step 4 and 5 at 5 years

HDFP defined goal DBP as 90mmHg for those entering with DBP 100mmHg or receiving antihypertensive therapy and a 10mmHg decrease for those entering with DBP of 90-99mmHg.

Mortality FU 5 years, mean BP data reported at 1 year and 5 years

Allocation concealment A – Adequate

Study Hypertension 1979a

Methods
Patients identified at 14 "HDFP centres throughout the US (13 by residential area- census tract, probability sample of larger areas, entire housing projects or in one centre by employment roll of industries). Randomisation at the patient level after initial screening. Initially screened for DBP, 2 stage process:
(1) All 158,096 screened (89% of all age-eligible patients), if average DBP was 95mmHg invited for second screen at clinic, regardless of whether taking BP lowering drugs or not.
(2) If mean DBP 90mmHg, patient eligible and randomised. 10,940 agreed to randomisation Randomisation stratified according to entry DBP and HDFP centre:
(1) Stratum i- 90-104 mmHg, n= 7,825 (71.5%)
(2) Stratum ii- 105-114 mmHg, n=2,052 (18.8%)
(3) Stratum iii- 115 mmHg, n=1,063 (9.7%)
Characteristics of included studies (Continued)

No SBP entry criteria and no upper limits of BP

11,386 persons randomised but 446 subsequently excluded due to randomisation error that occurred at one clinic

Participants

Study Hypertension 1986

Methods Patients identified at 14 "HDFP centres throughout the US (13 by residential area- census tract, probability
sample of larger areas, entire housing projects or in one centre by employment roll of industries). Randomi-
sation at the patient level after initial screening. Initially screened for DBP, 2 stage process:
(1) All 158,096 screened (89% of all age-eligible patients), if average DBP was 95mmHg invited for second
screen at clinic, regardless of whether taking BP lowering drugs or not.
(2) If mean DBP 90mmHg, patient eligible and randomised. 10,940 agreed to randomisation Randomisation
stratified according to entry DBP and HDFP centre:
(1) Stratum i- 90-104 mmHg, n= 7,825 (71.5%)
(2) Stratum ii- 105-114 mmHg, n=2,052 (18.8%)
(3) Stratum iii- 115 mmHg, n=1,063 (9.7%)

No SBP entry criteria and no upper limits of BP

11,386 persons randomised but 446 subsequently excluded due to randomisation error that occurred at one
clinic

Participants Inclusion criteria:
(1) Men and women age 30 to 69 years
(2) Average home screening DBP 95mmHg
(3) Confirmed follow up DBP 90mmHg

Exclusion criteria:
(1) Terminally ill
(2) Institutionalised

10,940 randomised, 54% male, 45% black

Antihypertensive drugs taken at start of RCT: SC (26.3%), RC (25.7%)

Interventions (1) Stepped care (SC), designed to provide rigorous, systematic, antihypertensive drug treatment by means
of:
"Free care- visits, drugs, investigations, transport
"Emphasis placed on clinic attendance and compliance- pill counts used
"Convenience- low waiting times, parmedical personnel, physician on call
"Stepped drug treatment according to BP response
"Patients seen at intervals determined by their clinical status, at least every 4 months, and generally every 2
months

(2) Referred care (RC): referred to their "primary sources of care, usually own physicians.

All SC (E) and RC (C) participants seen at home at years 1, 2, 4 and 5 for health history and BP measurement
and at the clinic at years 2 and 5 for an examination. At each contact each RC participant was advised to
visit a physician. If severe hypertension (DBP 115mmHg or end organ damage) special steps were taken to
achieve contact with a physician.

Outcomes (1) # (%) on antihypertensive medication- higher for SC 81.2%, compared to RC 64.2% by year 5.
Characteristics of included studies (Continued)

(2) SBP/DBP level- lower for SC (130/84mmHg) vs RC (140/89) at 5 year FU
(3) % controlled blood pressure (HDFP goal)- improved SC versus RC.
(4) All cause mortality- significantly better 350/5485 (6.38%) vs 421/5455 (7.78%)

All outcomes apply across 3 strata of entry DBP. Most of BP reduction occurred by end of year 1

Duration FU 1 and 5 years (mortality)

Notes
Data reported in 3 strata of entry DBP
At one year 84.4% (SC) versus 59.1% (RC) taking antihypertensive medication
Step 1- 32.7% v 12.1%
Step 2- 23.6% v 16%

HDFP defined goal DBP as 90mmHg for those entering with DBP 100mmHg or receiving antihypertensive therapy and a 10mmHg decrease for those entering with DBP of 90-99mmHg.

Mortality FU 5 years, mean BP data reported at 1 year and 5 years

Allocation concealment
A – Adequate

Study Jewell 1988
Methods Hypertensive patients in a single practice in the UK
Participants Patients aged 30-64 years.
Newly diagnosed: raised DBP >100mmHg aged 30-39, >105mmHg aged >40
Previously diagnosed: DBP >95mmHg on 3 measurements at a single visit
Interventions (1) Nurse-led clinic. Agreed protocol determined treatment and frequency of attendance in both groups.
Target was to reduce DBP <90mmHg, 15 minute consultation.
Note: both nurse led and doctor led care was by means of identical protocol.
(2) Usual care-general practitioner 10 minute consultation
Outcomes (1) Mean SBP/DBP- between group difference in mean SBP -0.8mmHg (-8.7 to 24.7) NS, DBP - 0.4mmHg (-6.2 to 7) NS.
(2) Proportion with DBP <90mmHg
10/15 (E- 67%)
12/19 (C- 63%)
(3) Quality of data recording (better in nurse group for pulse, weight, urine testing)
(4) Frequency of attendance (no difference, mean annual rates 5.7 (C)
6 (E) groups.
(5) Knowledge of medication (no difference)
(6) Reactions to the service (no difference)

Duration FU 1 year

Notes
Allocation concealment B – Unclear

Interventions used to improve control of blood pressure in patients with hypertension (Review)
### Characteristics of included studies (Continued)

#### Interventions

(1) Three interventions:
- "Exit interview- individualised 5-10 minute counselling session, explaining and re-inforcing instructions to the patient"
- "Instructional session with adult at home concerning adherence and follow up care"
- "Group sessions- three, one hour sessions led by social worker"
- "Seven experimental groups and one control group"

(2) Usual care with none of above interventions

#### Outcomes

(1) Deviation in weight from ideal weight- significantly better in patients who received all 3 interventions compared to those who received none

(2) Appointment keeping (ratio of kept/scheduled)- improved in group who received all 3 interventions versus control at 2 yrs (E) .68 versus (C) .63; no difference at 5 yrs (E) .95 versus (C) .83

(3) Adherence to drug therapy- all improved, greatest in 3 intervention arm versus control (53% vs 40%)

(4) % patients with controlled BP - increased at 2 years (E) 52% versus (C) 42%; 5 years (E) 66% versus (C) 56%. Significantly better in four intervention groups compared to control at 5 years

(5) All cause mortality- cumulative mortality better in all experimental groups combined (12.9) compared to control group (30.2)

(6) Cost effectiveness- multiple interventions appear more effective, not necessarily more cost effective. Authors feel that may be better to use single interventions depending on setting and financial constraints

Duration of FU 2 and 5 years.

### Notes

Multiple comparisons in results section: 7 intervention arms and one control group

In addition no a priori sub-group analysis

Blood pressure control age-specific categories

- <40 <140/90
- 40-59 <150/95
- 60, <160/100

Substantially greater numbers lost to follow up in (C) arm at 2 and 5 years

### Allocation concealment

D – Not used

---

**Study**

**Logan 1979**

**Methods**

Parallel

Individuals

**Participants**

Volunteers from business settings with newly diagnosed hypertension (DBP 95mmHg, or DBP 91-94mmHg and SBP >140mmHg)

**Interventions**

(1) Work-site care- nurse management according to a standard protocol- including drug regimen and regular review, once monthly if BP not controlled

(2) Usual care from their own family physicians

**Outcomes**

(1) # patients taking BP treatment- increased in Experimental group (177/206, 86% vs 108/204, 53%)

(2) Mean DBP- improved in (E) 94.3mmHg versus (C) 90.3mmHg, p<0.01.

(3) Reach goal DBP- 50% (E) versus 28.9% (C).

(4) Compliance-better in experimental group (67.6% vs 49.1%)

Duration of FU 6 months

**Notes**

Goal DBP <90mmHg if entry DBP >95mmHg; or <6mmHg in those with entry DBP 95mmHg or less.

**Allocation concealment**

B – Unclear

---

**Study**

**Martínez-Amenos 1990**

**Methods**

Parallel

Individuals
Characteristics of included studies (Continued)

Participants
Hypertension Registry from 19 primary care centres in Spain. Mean age 61 years, 59% female
Initial volunteers asked if they wished to participate; those agreeing were randomised and labelled "motivated" group; group who declined to participate also followed up "non motivated" group

Interventions
(1) Individual education - comments and explanations to errors encountered in answers to baseline knowledge questionnaire
(2) Team education - 2 talks given by nurses or doctors with AV material to 8-12 patients
(3) Control group

Outcomes
(1) Proportion of patients in each group with uncontrolled hypertension (SBP <160, DBP <95mmHg) - within group increase reported for both intervention arms, individual 50.4% to 60.9%, team, 55.8% to 68.8%, non significant within group change in control group, 54.4% to 58.9%
(2) Patient knowledge - no between group difference, individual 19.79, Team 20.58, control 19.78

Duration of FU: 2 months

Notes
Knowledge increased within all 3 groups over time, between group comparison not statistically tested
No baseline numbers per arm of study reported
% control BP not included in meta-analysis as no denominator data available at start of RCT

Allocation concealment
B – Unclear

Study
McAlister 1986

Methods
Cluster (60 doctors initially, 10 dropped out), parallel, Toronto Canada

Participants
N=50 general practitioners, 1241 (E) 990 (C), hypertensive patients with one of the following:
(1) DBP >90 mmHg on treatment
(2) DBP >104 mmHg not on treatment
(3) DBP >90 or <105 mmHg unless evidence of complications or risk factors
(4) Newly detected patients with "high blood pressure" detected during the trial

Interventions
(1) Computer generated feedback to physician: "Cumulative chart of patient's DBP"
"Inter and Intra practice DBP ranking"
"Commentary on treatment by GP according to a "stepped care" approach"
(2) Control group filled out same forms but no feedback given

Outcomes
1) Workload: GPs in experimental group saw more patients
2) Mean score on length of follow up: better in intervention 199.3 days (E) vs 167days (C)
3) Drop outs: 37.5% (E) vs 42.1% (C)
4) In all patients DBP reading in those with initial DBP > 104mmHg: 88.5mmHg (E) vs 93.3mmHg (C), net DBP change 0.8mmHg P <0.1
5) % patients with controlled DBP (90mmHg)- 88.9% (E) versus 87.5% (C) NS
6) # days with sustained DBP control 323 (E) vs 259(C)
7) # times visited GP: 13.3 (E) vs (17.4)

Duration 16 months

Notes
Multiple outcomes reported, some favourable for experimental arm- saw more patients who were less likely to drop out of care. Doesn't appear to have had an impact on overall DBP control but other measures of BP control favoured intervention group such as number of days with sustained DBP control. This was achieved with fewer visits in the intervention group

Allocation concealment
B – Unclear

Study
Mehos 2000

Methods
Parallel, individuals in a single family medicine clinic, US
Characteristics of included studies *(Continued)*

| Participants | 41 uncontrolled hypertensives, SBP 140-179mmHg and/or DBP 90-109mmHg, currently on treatment, mean age 59 years, 70% women |
| Interventions | (1) Home blood pressure monitoring, diary and instruction to measure blood pressure, information on hypertension and risk factors, subsequent evaluation by clinical pharmacist (2) Usual care |
| Outcomes | (1) SBP, DBP and mean BP- all reduced in (E) group, SBP (E) 140.8mmHg versus (C) 146.9mmHg (p=0.069), DBP (E) 80.6mmHg versus (C) 85.6mmHg (p=0.02), (2) Compliance (self report)- mean adherence 82% (E) vs 89% (C) (p=0.29) (3) Drug alteration (dosage increase, addition or switch)- 83% (E) vs 33% (C) (p=0.29) (4) Quality of life (SF36)- no difference between groups |

Notes
- Duration of FU 6 months
- Allocation concealment B – Unclear

**Study** Midanik 1991

| Methods | Parallel, individuals, from a single foundation health plan in California, US. |
| Participants | 204 untreated hypertensive patients with "mild" hypertension- SBP <180mmHg and DBP 90-99mmHg |
| Interventions | (1) Self monitoring- patients trained to take two consecutive readings twice a week. Sent in readings every 4 weeks for one year(2) Usual care |
| Outcomes | (1) Blood pressure- mean change SBP -1 mmHg, mean change DBP -1 mmHg (E) versus mean change SBP +1 mmHg, mean change DBP -1 mmHgDuration of FU 1 year |

Notes
- Untreated subjects with 18% of (E) and 17% of (C) patients taking antihypertensive medication at the end of the RCT
- Allocation concealment B – Unclear

**Study** Montgomery 2000

| Methods | 27 general practice in UK, Cluster RCT, patients on register |
| Participants | Hypertensive patients aged 60-80 taking BP lowering drugs. Randomly selected from practice register |
| Interventions | (1) Computer based decision support system (CDSS) (2) Risk chart Both interventions provided health professional (general practitioner or practice nurse) with explicit cardiovascular risk. Based on New Zealand hypertension guidelines. (3) Usual care |
| Outcomes | (1) Cardiovascular risk- no change in CVD risk between 3 groups (2) SBP/DBP- adjusted analysis, chart group had better mean SBP reading than usual care (difference 4.6mmHg) (3) Proportion of patients with controlled hypertension (<160/90)- no difference between two intervention groups chart 39.7%, CDSS 47.5% and control 40.7% (4) Medication change- intensity of BP medication prescribing greater in chart group compared to usual care Duration of FU 1 year |

Notes
- Allocation concealment A – Adequate

**Study** Morisky 1983

| Methods | Factorial trial with 8 groups of various combinations of the 3 interventions and control individuals at two hypertension clinics in US |
Characteristics of included studies (Continued)

Participants 91% black, median age 54 years, 70% female, low income ($45250 median yearly income).
BP (mmHg) entry criteria based on age:
20-39: >140/90
40-59: >150/95
60: 160/100

Interventions (1) Three interventions:
"Exit interview- individualised 5-10 minute counselling session, explaining and re-inforcing instructions to the patient
"Instructional session with adult at home concerning adherence and follow up care
"Group sessions- three, one hour sessions led by social worker
"Seven experimental groups and one control group
(2) Usual care with none of above interventions

Outcomes (1) Deviation in weight from ideal weight- significantly better in patients who received all 3 interventions compared to those who received none
(2) Appointment keeping (ratio of kept/scheduled)- improved in group who received all 3 interventions versus control at 2 yrs (E) .68 versus (C) .63; no difference at 5 yrs (E) .95 versus (C) .83
(3) Adherence to drug therapy- all improved, greatest in 3 intervention arm versus control (53% vs 40%)
(4) % patients with controlled BP - increased at 2 years (E) 52% versus (C) 42%; 5 years (E) 60% versus (C) 56%. Significantly better in four intervention groups compared to control at 5 years
(5) All cause mortality- cumulative mortality better in all experimental groups combined (12.9) compared to control group (30.2)
(6) Cost effectiveness- multiple interventions appear more effective, not necessarily more cost effective.
Authors feel that may be better to use single interventions depending on setting and financial constraints

Duration of FU 2 and 5 years.

Notes Multiple comparisons in results section: 7 intervention arms and one control group
In addition no a priori sub-group analysis
Blood pressure control age-specific categories
<40 <140/90,
40-59 <150/95
60, <160/100
Substantially greater numbers lost to follow up in (C) arm at 2 and 5 years

Allocation concealment B – Unclear

Study Muhlhauser 1993

Methods 10 general practices Germany, 20 hypertensive patients randomly selected (age 30-60 years)
Participants Hypertension (mean last 2 measurements 160 and/or 95). Taking BP medication (E 77%, C 86%)

Interventions (1) Hypertension treatment and teaching programme (HTTP) consisted of:
"Four consecutive meetings lasting 60-90 mins in groups of 4-6.
"Provided by physician assistants
"Responsibility including BP self monitoring
"Confirming diagnosis and treatment by using home BP measurements
"Emphasis on non-pharmacological treatment
Doctors (8 hours) and assistants (20 hours) in intervention practices attended preparatory course but RCT aimed principally at patients
(2) Usual care

Outcomes (1) Change in SBP/DBP- significantly improved at follow up, difference SBP 5mmHg, DBP 4mmHg
(2) Proportion of patients with controlled hypertension (<140/90)- no difference (E) 14% versus 15% (C)
(3) # BP drugs taken
Characteristics of included studies (Continued)

Duration of FU 18 months

Notes
(1) Only 46 (46%) in intervention group received intervention
(2) Cluster RCT not accounted for design or analysis.
(3) Well conducted RCT but differential losses to FU
(4) Less people in intervention group taking BP medication at end of RCT (mean # (E)- 1.2, (C) 1.8)

Allocation concealment B – Unclear

Study | New 2004
---|---
Methods | Cluster RCT
Participants | General practices
44 general practices, Salford, UK, 10303 participants
Interventions | (1) Educational outreach: specialist nurses arranged a schedule of visits with general practitioners and practice nurses, reminding them of protocols and clinical targets; provided educational material and protocols used in secondary care for nurse and doctor interventions including stepping up pharmacotherapy when necessary.
(2) usual care
Outcomes | (1) Proportion of participants reaching blood pressure target/OR: no difference between groups OR 1.01 (95% CI 0.8 to 1.3, p=0.93).
Notes | Study funded by pharmaceutical company.
Allocation concealment | B – Unclear

Study | Ornstein 2004
---|---
Methods | Cluster RCT, 20 community-based family or general internal medicine practices in 14 US states. 44 physicians, 17 “midlevel” providers and approximately 200 staff members
Participants | Of 87,291 patients from 20 practices, 7772 (8.9%) with hypertension. At baseline 40% (E) and 43.7% (C) had “controlled” blood pressure (<140/90).
21 study indicators included:
- Hypertension (5) including most recent BP measurement <140/90 for patients with a diagnosis of hypertension
- Hyperlipidemia (2)
- Coronary heart disease (6)
- "Heart failure (1)
- Atrial fibrillation (1)
- Diabetes (6)
Interventions | (1) Multi-method quality improvement (QI):
- Practice site visits (6-7, 1-2 day site visits in a two year period) involving physicians and pharmacist with expertise in academic detailing. Healthcare providers encouraged to use (QI) tools
- Two-day network meetings in each study year. Initial meeting directed at lead clinician with "best practice" presentations made by participating clinicians who were performing well. Clinical and administrative staff attended second meeting
(2) Usual care- received copies of practice guidelines and quarterly performance reports
Outcomes | (1) Control BP <140/90mmHg improved 58.4% (E) versus 51.9% (C), adjusted difference 8.0 (0.0 to 16.0), p=0.047
Notes | General multi-method across 6 conditions and 21 quality indicators. Overall intervention practices improved 22.4 percentage points in terms of indicators at or above target, compared to 16.4 in control practices, difference 6.0 percentage points (p>0.2).
Patients in intervention practices had greater improvements than control practices for diagnosis of hypertension and blood pressure control
Duration of FU 2 years

**Notes**
- Improved recording of blood pressure and other cardiovascular risk factors
- Duration of FU 2 years
- Allocation concealment: B – Unclear

### Study: Roca-Cusachs 1991

**Methods**
- Parallel, individual in a hypertension clinic, Spain

**Participants**
- Newly diagnosed hypertensive patients (excluded age >70, illiterate and “high probability of non attendance”)
- Entry SBP/DBP noted but no threshold required for eligibility. Mean values were:
  - (E) 156.3/95.8
  - (C) 160.3/96.1

**Interventions**
- (1) Patient education:
  - "Booklet at initial entry into study
  - "Two educational talks. First educational talk given by pharmacist and doctor, covered information about hypertension, treatment adherence and appointments; second educational talk given by dieticians covered non-pharmacological treatments.
  - "Personal tutorial meeting one month later solve problems, clarify misunderstandings and re-enforce knowledge.
- (2) Usual care

**Outcomes**
- (1) Weight: no difference
- (2) Mean SBP/DBP: no difference
- (3) Withdrawals: 39% (E) vs 26% (C) significant difference
- (4) Knowledge questionnaire: improved knowledge in (E) group
- (5) Number of BP pills taken: no difference
- (6) Biochemical markers: no difference

**Notes**
- Knowledge improved, other outcomes no difference, withdrawal from the programme greater in the (E) 39% versus (C) 25%
- Large proportion of (E) failed to attend an educational session, 83/138 (60%).
- Sub-group analysis showed that 55/138 (40%) who attended one or more educational session did not have a different outcome in terms of all outcome measures at follow up, including SBP/DBP than those in intervention group who failed to attend sessions 83/138 (60%), except that those who attended had significantly higher probability of not withdrawing overall 3.6% vs 63%.

**Allocation concealment**
- D – Not used

### Study: Rogers 2001

**Methods**
- Medical outpatients department, patients covered by insurance under care of 5 internists, New York state, US.

**Participants**
- Previous diagnosis of hypertension but were being considered for change in BP medication because:
  - (1) SBP 140 or DBP 90 despite current antihypertensive therapy
  - (2) Side effects from drugs
  - (3) SBP >180 or DBP >110 without current antihypertensive therapy

**Interventions**
- (1) Telecommunication service with 3 components:
  - "Automated BP at home with no self report
### Characteristics of included studies (Continued)

"Central processing of BP readings
"Weekly reports to both physician and patient. When physicians received report forms that indicated increased blood pressure they adjusted BP medication via telephone call, office visit or both. Readings minimum of 3 days each week for minimum 8 weeks

#### Outcomes

(1) Mean change in arterial blood pressure- improved -2.8mmHg (E) versus +1.3 (C) p=0.013
(2) Mean change in systolic blood pressure- improved -4.9mmHg (E) versus -0.1 (C) p=0.047
(3) Mean change in diastolic blood pressure- improved -2mmHg (E) versus +2.1 (C) p=0.012

Median duration of FU 11 weeks

#### Notes

Change in mean arterial BP primary outcome via 24 hr ambulatory reading
Change in BP medication related to change in mean arterial BP and was more common in intervention group, 33% (E) versus 7% (C) group.
No change in median number of office visits
Difference in median length of FU (longer in intervention group, 79 vs 72 days)
Satisfaction with care same in both groups

#### Allocation concealment

A – Adequate

---

### Study

##### Rudd 2004

#### Methods

Parallel RCT, two medical clinics

#### Participants

Hypertension- SBP ≥140 mmHg or DBP ≥90mmHg in previous six months or history of drug treatment. Drug therapy for patients with 150 mmHg or DBP 95 mmHg.

#### Interventions

(1) Self measurement with nurse management based on algorithm. Twice daily measurement, after 14 measurements mailed to nurse care manager who used this BP data to give management. Additional interventions included tips on enhancing drug adherence and recognition of possible side effects; printed materials; follow up calls at 1 week, 1, 2 and 4 months. Nurse contacted physicians to initiate new drugs not did not contact physicians when changing medication dosage. Increase in drug dose occurred when <80% measurements met criterion of 130/85mmHg.(1)

#### Outcomes

Usual care

#### Notes

(1) Blood pressure- mean change DBP -6.5 mmHg (E) versus mean change DBP 3.4 mmHg (C)

#### Allocation concealment

B – Unclear

---

### Study

##### Sackett 1975

#### Methods

Factorial RCT

#### Participants

Steel mill employees in Canada

#### Interventions

(1) Augmented convenience (AC)
Saw on-site physicians during working hours and on full pay versus usual care of seeing their own GP
(2) Mastery learning (ML)
Educational programme designed to give them the facts about hypertension, including compliance advice and reminders about pill-taking. Information supplied in audio-casette and booklet. Mastery learning re-emphasised by a "patient educator"
(3) Both intervention
(4) Usual care

#### Outcomes

(1) Number men placed on BP medication increased in both groups
AC (87/114, 76% vs 57/116, 49%)

| Webb 1980     | Patients had to have at least: one year history of hypertension; uncontrolled DBP 90mmHg; taking BP lowering drugs | (1) Education- three group education sessions by nurse-health educator (causes, nature, implications and treatment of hypertension)  
(2) Counselling- three "individualized" counselling sessions  
(3) Usual care- three appointments with family physician | (1) DBP- no difference between either group and usual care- education (E1) 88.9mmHg versus (C) 88.1mmHg, counselling (E2) 87.4mmHg versus 88.1mmHg  
(2) Compliance- no difference between either group and usual care  
(3) Return for follow up appointment- no difference education (E1)10.1 versus (C) 10.2, counselling (E2) 11.2 versus 10.2 | Duration of FU 6 months | B – Unclear |
| Zarnke 1997   | Age 52 (E) 56 (C), 13 (42%) male, average BP readings < 160/95, taking BP lowering drugs or receiving non-pharmacological advice | (1) Patient-directed group- instructed in home BP measurement, measured own BP twice daily and instructed by means of algorithm to change own BP medication, if still exceed goal to contact family doctor  
(2) Office-based group- adjustments to BP medication made by family doctor | (1) Change in daytime mean arterial BP adjusted for baseline measurement- decreased significantly in (E) group -0.95 versus +1.9 (C)  
(2) Compliance (doses missed per week- (E) 0.05 versus (C) 0.2 NS  
(3) Quality of life scores- no difference  
(4) Indices of health care resource use- total number of physician visits significantly greater in (E) group, no difference in total number of BP drugs used | Duration of FU 8 weeks | Small RCT (n=31), short period of follow up | B – Unclear |
**Study** | **Zismer 1982**
---|---
**Methods** | Hypertensive patients in a single urban family practice. 176 eligible, 50 randomly selected, 39 agreed to take part. 3 groups- two separate intervention groups treated as the same in the analysis.

**Participants** | Diagnosis of hypertension or receiving BP lowering drugs or elevated BP for 2 consecutive visits 140 or 90mmHg within previous 12 months 37 black, 21 male, average age 45 (E) 56 (C), age range 21 to 76.

**Interventions** | (1) Experimental group A- Educational “self-care” intervention: pill taking; appointment keeping; dietary sodium reduction  
(2) Experimental group B-received additional support from family member.  
(3) Usual care

**Outcomes** | (1) Systolic blood pressure- improved 150.9mmHg (C) versus 130.5mmHg (E), p<0.01.  
(2) Diastolic blood pressure- improved 92mmHg (C) versus 85mmHg (E), p<0.001.  
(3) Frequency of visits- no difference between groups in mean number of visits

**Notes** | BP readings at baseline and FU were mean of last 3 readings  
Control group was not similar to experimental group: 10 years older and diagnosed for longer

**Allocation concealment** | B – Unclear

### Characteristics of excluded studies

<table>
<thead>
<tr>
<th>Study</th>
<th>Reason for exclusion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Andrejak 2000</td>
<td>Randomised trial of once daily versus twice daily ace inhibitor. Outcome compliance as judged by mem's monitored. Once daily medication better than twice daily dosage. Included in adherence systematic review. Excluded: adherence RCT</td>
</tr>
<tr>
<td>Bachman 2002</td>
<td>Accuracy and quality of self-reported home blood pressure values assessed. 48 patients randomised to receive information about storage capabilities of a home measuring device or not. Accuracy and interpretation of home blood measurement increased in the informed group. Reason for exclusion: intervention not aimed directly at improving blood pressure control; no blood pressure data reported.</td>
</tr>
<tr>
<td>Barron-Rivera 1998</td>
<td>Randomised trial of education programmed to patients. Outcome was well-being and quality of life. Excluded: no report on blood pressure control in the process of care.</td>
</tr>
<tr>
<td>Ben Said</td>
<td>Randomised trial of assessment education interventions - same trial as reported by Consoli. Excluded: no outcome on blood pressure or process of care reported.</td>
</tr>
<tr>
<td>Binstock 1988</td>
<td>Excluded because no “usual care” group.</td>
</tr>
</tbody>
</table>
| Birtwhistle 2004 | Equivalence RCT of three month versus six month follow up. Reason for exclusion:  
(1) Neither intervention met inclusion criteria of the review. No additional intervention directed at either patient, health professional or organisation of care.  
Finding that BP control was equivalent between three and six month follow up arms of the study. Both groups saw health professional much more often than planned over the three years- mean (sd) visits per patient in three month group 18.8 (8.06) versus 16.2 (8.45) in six month group. |
| Blenkinsopp 2000 | Parallel, cluster randomised, 20 community pharmacy sites, UK. 180 treated hypertensives, 62% age 60 or over. (1) Pharmacist delivered, Structured, brief questioning protocol on medication problems; including advice, information and referral to general practitioner versus usual care, delivered three times at two-month intervals |
(2) Usual care. (1) % with controlled hypertension- of those patients with initially uncontrolled hypertension (160/90mmHg) (E) 35.7% versus (C) 17.1% were controlled at follow up (p<0.05), no difference in BP control in those who were controlled at start of study
(2) Compliance (self report)- 62% (E) versus 50% (C) (p<0.05)
(3) Patient satisfaction- high level with service and no significant differences between groups. Duration of FU 6 months. Substantial losses to follow up. Subgroup analysis of % controlled blood pressure, therefore not included in analysis. Reason for exclusion: no blood pressure data.

<table>
<thead>
<tr>
<th>Reference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bond 1984</td>
<td>Non-randomised trial of clinical pharmacist nurse clinician improving drug documentation, for blood pressure control and rheumatology/renal screening. Excluded: no BP outcome data</td>
</tr>
<tr>
<td>Broege 2001</td>
<td>40 hypertensive men and women randomly assigned to “home” self measurement with subsequent management and medication change compared to “clinic” group where medication adjusted based upon readings taken by project nurse. Reasons for exclusion: 1. Includes treated and untreated hypertensive patients. Drug treatments adjusted downward or treatment initiated depending on BP reading and drug treatment status. Not possible to detect effect of self monitoring on treated blood pressure alone. 2. No usual care- both groups experienced monitoring- self monitoring at home or nurse monitoring in clinic.</td>
</tr>
<tr>
<td>Cappuccio 2004</td>
<td>Systematic review of home monitoring. 18 RCTs included- several RCTs excluded from this review that Cappucino included. These are (with reasons why excluded from this review in brackets): Binstock- no usual care group included. Stahl- non randomised trial, patients allocated “sequentially”. Midanik-</td>

<tr>
<td>Caro 1998</td>
<td>Non-randomised trial. Observational study of compliance and persistence with therapy, excluded for these reasons.</td>
</tr>
<tr>
<td>Celis 1998</td>
<td>A randomised controlled trial protocol comparing self measurement of blood pressure against conventional blood pressure measurement. Protocol of trial. Excluded: no results reported.</td>
</tr>
<tr>
<td>Charlesworth 1984</td>
<td>Quasi randomised trial. Patients assigned random numbers and then rank ordered. The first 32 were given intervention, the next 22 were in the control group. Intervention was of stress management outcome SBP and DBP was significantly reduced in the stress management group. Excluded: intervention and wasn’t properly randomised.</td>
</tr>
<tr>
<td>Consoli</td>
<td>Randomised trial of computer assisted programme intervention was educational. Outcome knowledge increased at two months in intervention group compared to control. Excluded as no outcome on blood pressure or process of care reported.</td>
</tr>
<tr>
<td>Consoli SM, Ben2</td>
<td>Randomised trial of computer assisted programme intervention was educational. Outcome knowledge increased at two months in intervention group compared to control. Excluded as no outcome on blood pressure or process of care reported</td>
</tr>
<tr>
<td>Consoli SM, Ben3</td>
<td>Randomised trial of computer assisted programme intervention was educational. Outcome knowledge increased at two months in intervention group compared to control. Excluded as no outcome on blood pressure or process of care reported</td>
</tr>
<tr>
<td>Cranney 1999</td>
<td>Non-randomised trial 9 pairs of practices matched by means of overall blood pressure control and then randomised to educational intervention directed to health professionals in the practice. The outcome was a stated threshold for blood pressure control. Excluded because of non-randomised trial design.</td>
</tr>
<tr>
<td>Denver 2003</td>
<td>120 Type 2 diabetic patients with uncontrolled hypertension (BP &gt;140/90) randomised to usual GP care or nurse-led outpatient care. Nurse led care associated with improved systolic blood pressure. Reasons for exclusion: (1) patients allocated by means of alternation rather than randomisation (2) setting.</td>
</tr>
<tr>
<td>Djerassi 1990</td>
<td>Non-randomised trial, before/after design. Intervention was based in factories program of follow-up treatment by planned doctor and nurse versus usual care by family doctor in other factories. Outcomes number of percentage of people treated with an intervention group was greater.</td>
</tr>
<tr>
<td>Dusing 1998</td>
<td>Observational study of 1603 patients in 320 private practices in Germany. Investigated change in antihypertensive therapy within six months of start of study. Inadequate BP control most important reason for change</td>
</tr>
</tbody>
</table>
in 48.4% of patients in the cohort, others include: adverse effects 30.1%, patient dissatisfaction 20%, non-compliance 16.8%, cost 4.9%.

<table>
<thead>
<tr>
<th>Study</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Erickson 1997</td>
<td>A non-randomised trial of pharmacist care which involved reviewing medical records, taking drug history, assessing patients specific drug issues, concerns about taking drugs, lifestyle, compliance and knowledge all direct to the patient. Outcomes SBP and DBP were reduced in the group who received a pharmacist's care at 5 months. Quality of life measures were the same. Trial excluded because it was not randomised.</td>
</tr>
<tr>
<td>Flack 1995</td>
<td>Observational study reporting adherence rates with different classes of anti-hypertensive agents.</td>
</tr>
<tr>
<td>Flack 2000</td>
<td>Randomised trial of slow versus fast titration of blood pressure lowering drugs.</td>
</tr>
<tr>
<td>Foote 1983</td>
<td>Quasi randomised controlled trial. Four interventions, screening and referral to physician, referral to physician and semi-annual follow-up, referral to physician and more frequent follow-up, and on-site treatment. Outcome was the number of people under treatment, control and proved in the last three groups.</td>
</tr>
<tr>
<td>Girvin 1999</td>
<td>A randomised trial cross-over design of single versus twice a day Enalapril. The outcomes were of compliance which increased with the single dose medication and blood pressure control which is better in the twice a day medication group. Reason for exclusion, adherence randomised trial, included in the adherence systematic review.</td>
</tr>
<tr>
<td>Godley 2003</td>
<td>Evaluation of a quality improvement programme for hypertension management. Intervention consisted of educating healthcare providers and recommending appropriate pharmacotherapy for compelling indications. 30,721 hypertensive patients identified from pharmacy claims, 417 patients randomly selected for note review. Overall level of blood pressure control stated to have improved from 37.2% to 49.2% at follow up. Reason for exclusion: not a randomised study; no comparison group.</td>
</tr>
<tr>
<td>Gonzalez-Fernandez</td>
<td>Parallel, individuals, hospitalised for &quot;non-hypertensive related diseases) in a single hospital, Puerto Rico, 60 treated hypertensives, 55% women, mean age 59 years. (1) In-hospital education- 4 educational interventions: &quot;knowing high BP&quot; by a physician; &quot;diet and high BP&quot; by a dietitian; &quot;exercise and high BP&quot; by a health educator; &quot;medications and compliance in high BP&quot; by physician and pharmacy student. (2) Usual care. (1) Blood pressure control- SBP and DBP improved in (E) 137mmHg versus (C) 154mmHg (p=0.005), diastolic (E) 89mmHg versus 98mmHg (p=0.006) (2) Compliance (direct questioning and pill count)- adherence improved by 66% in the intervention group compared to 16% in usual care group (p=0.04). Reason for exclusion: hospital-based RCT. Duration of FU 8 weeks</td>
</tr>
<tr>
<td>Grimm</td>
<td>A randomised trial of four different class of anti-hypertensive agents and quality of life. Excluded: no data on BP control, no interventions other than different classes of anti-hypertensive drugs.</td>
</tr>
<tr>
<td>Hatcher 1986</td>
<td>Factorial randomised trial of health education intervention. Three levels of intervention medication schedules, diet, appointment keeping, family member, reinforcements and small group meeting. Excluded as intervention was based on education and no outcomes on blood pressure control in the process of care.</td>
</tr>
<tr>
<td>Herbert 2004</td>
<td>2x2 factorial RCT of 28 peer learning groups involving 200 family physicians in British Columbia, Canada. Interventions: personalised prescribing feedback relating to hypertension; case-based educational module. Evidence-based prescribing improved in both groups (increase in thiazide prescribing as first line agents). Reason for exclusion: no blood pressure outcomes reported.</td>
</tr>
<tr>
<td>Hyman</td>
<td>Questionnaire study self reported physician practice excluded for that reason.</td>
</tr>
<tr>
<td>Inui 1976</td>
<td>Before/after study intervention with tutor physician educating patients regarding their hypertension. Excluded: not a randomised trial.</td>
</tr>
<tr>
<td>Iso 1996</td>
<td>Randomised trial of health education advice (non-pharmacological) follow-up was at 6 months and one and half years. Excluded: intervention was based around health education/counselling advice.</td>
</tr>
<tr>
<td>Iso H,</td>
<td>Randomised trial of health education classes to patients. Excluded as intervention was non-pharmacological advice.</td>
</tr>
<tr>
<td>Jennett 1986</td>
<td>RCT of continuing medical education in the context of treatment of hypertension. Intervention focused on three learning objectives: 1) physicians reschedule diagnosed hypertensive patients (aged 50 years or older) not as yet in control, to be seen at least every month until controlled; 2) physicians take blood pressure of</td>
</tr>
</tbody>
</table>
hypertensive patients in the supine position and also within one minute after standing on every visit and the
patient's position is recorded with their blood pressure record; 3) physicians ask patients who have not yet got
controlled blood pressure about their compliance in taking prescribed medication and record the answer. Two
educational formats used: 1) six to eight page educational newsletters; 2) small group discussion. Behaviour
change improvement scores with the intervention group compared to control. Behaviour was sustained 12
months post education. Reason for exclusion: no blood pressure data reported.

Krishan 1979  Non-randomised trial of nurse practitioner and integrated physician supervised management in community
hypertension clinics versus usual care. No difference in outcome of blood pressure control.

Levine 2003  RCT of community health workers providing less intensive care (education, counselling and information
about gaining access to free ongoing care in the community) versus more intensive care (all components
of less intensive intervention plus additional home visits, further educational messages and social support
mobilization through family members). At 40 months follow up, both groups experienced improvement
in blood pressure control (significant within group difference from baseline blood pressure readings). Less
intensive group had greater blood pressure control compared to more intensive group but difference was not
significant. Reason for exclusion: no usual care group.

Lewis 1967  Randomised trial of nurse clinics versus usual care in outpatient clinic. The population included patients
with Hypertension and Atherosclerotic Disease, Obesity, Arthritis and Psychophysiological Disorders. The
outcomes are preferences for care, costs and process of care in terms of examinations and investigations.
Excluded: no data on process or outcome of blood pressure care.

Linjer 1997  Non-randomised trial. Discussion paper regarding percentage of patients eligible in randomised trials generally
at low risk in trial participants.

Littenberg 1990  Non-randomised trial. Cost effectiveness study of increased blood pressure.

Marquez 2000  Randomised trial intervention being health education through group sessions with postal back-up. Outcomes
were compliance with blood pressure medication. Excluded as no outcome in terms of blood pressure control
reported.

Mashru 1997  Before after study of interpractice audit following educational programme concerning diagnosis and man-
agement of hypertension. Six general practices in NW London, UK, 750 hypertensive patients. At two years
follow up, two thirds of patients remained “uncontrolled” (BP<160/90).

McDowell 1989  Non hypertensive patients registered with a large family practice (Canada). Interventions: computer reminder
to GP, letter to patient, nurse telephone call to patient. Outcome was whether blood pressure was checked or
not. Effect of reminders was “modest”

McInnes 1995  Non-randomised trial two patients were matched and then randomised to it. Shared care or clinical care.
The intervention was computerised shared care versus hospital clinical care in outpatients departments. The
outcome showed there were less drop-outs for shared care and they were better adequately used in terms of
patient management in shared care compared to usual care. Shared care was more cost effective. Blood pressure
control was similar in both groups.

McKenney 1973  A pharmacist intervention directly at patients improved knowledge compliance with medication and blood
pressure control, however not randomised properly. Patients assigned consecutive numbers then randomised
according whether they had odd or even numbers.

to prompt attendance at clinic, either single, multiple or no mail. Outcome: number of patients who had a
blood pressure checked or discussed with their physician.

New 2003  Specialist nurse-led clinic in a single outpatient clinic in Salford, UK. Population: diabetic patients receiving
hospital-based care. Comparison group: usual hospital care. Outcome: improvement in blood pressure and
hyperlipidemia targets achieved with intervention. Reason for exclusion: hospital-based, (2) diabetic patients.

Pheley 1995  Observational study of nurse based hypertension clinic with no comparison group.

Putnam 1989  40 family physicians from the Dalhousie University Division of Continuing Medical Education separated into
3 groups according to extent of involvement in establishing essential criteria for hypertension management.
No difference in control of blood pressure in these family physician's patients at 18 months follow up. Reason for exclusion: non randomised trial

Ramsay 1996  
Non-randomised trial. Discussion paper.

Staessen 2004  
Randomised trial of treatment based on (1) BP measured at home (3 consecutive measurements twice daily) versus (2) BP measured at physician's office (average of 3 consecutive readings taken by physician during practice hours). Reason for exclusion: (1) Assessed self monitoring in the context "as guides to initiate and titrate antihypertensive drug treatment". (2) Treated and untreated patients included. At follow-up (median 350 days), more home BP than office BP patients had stopped antihypertensive drugs with no difference between groups of patients who had progressed to multiple drug treatment. Final office, home and 24-hour ambulatory BP measurements were higher in the home BP group than in the office BP group.

Stahl 1984  
Non-randomised trial. Self and family read blood pressure monitoring groups plus nurse education. Excluded because of non-randomised study.

Statson 1977  
Non-randomised trial. Examining the cost effectiveness of treatment of hypertension

Stephenson 1999  
Non-randomised trial.

Trocha 1999  
91 hypertensive type 1 diabetic patients with overt diabetic nephropathy followed for 10 years. Intensified versus routine antihypertensive treatment. Blood pressure control and survival improved in the intensified group. Reason for exclusion: non randomised study

Tu 1999  
Parallel, individuals 222 attending a "health unit clinic", carried out in a veteran home in Taiwan, China. Hypertension, SBP 140 or DBP 90 in untreated patients or treated hypertension patients BP level not stated. Average age 74.6 years. (1) Medical education group (MEG)- monthly meeting concerning cognition, attitude self-care behaviours for hypertension (2) Health education- same content but delivered every other month group (EOMG). Differences between groups not clearly reported. Stated that no difference in attitudes and behaviour between groups. Blood pressure no difference in SBP but higher DBP in EOMG. Between group differences not clearly stated. Table 3, within group differences all improved for "cognition, behaviours and attitudes" scores and "blood pressure marking" changes. Duration of FU 6 months. Reason for exclusion: no BP data for both arms of study reported.

UK PDS 1998  
Randomised trial of tight less tight blood pressure control. Excluded because its not reporting on process and organisational issues in hypertension care.

Waerber 1999  
Randomised trial of compliance in terms of aspirin versus placebo from the HOT randomised controlled trial

Weiner 1980  
Cluster- six "industrial settings" randomised. Ohio county clinics US, SBP>140 or DBP >90 age 19-39, SBP >150 or DBP >90 age 40-64. (1) Nurse management. Involved reinforcement to take medication, information about side effects of medications, diet instruction, BP checks, weight checks, education and counselling regarding "an understanding and acceptance of hypertension", (2) Usual care. Positive RCT reported. Experimental patients had better: (1) Decreases in maximum SBP (p=0.02) (2) Average SBP (p=0.02) (3) % overweight (p=0.01) (4) Improved knowledge (p=0.002). Duration FU 3 months. No difference found for maximum and average DBP between (E) and (C). Only very brief account of RCT with no details of baseline or follow up blood pressure. Reason for exclusion: no blood pressure data.

Weir 2002  
Questionnaire survey a combination of lifestyle medication taking in half outcomes

Wollard 1995  
Randomised trial at two levels of intensity, lifestyle advice/counselling from practice nurses. Outcome was lifestyle and non-pharmacological change in patients. Excluded because intervention was based on non-pharmacological advice and outcomes included lifestyle changes. Of note intervention was more effective than usual care.
Characteristics of excluded studies (Continued)

Wyka-Fitzgerald 1984 Randomised trial of nurse education programme directed at patients intervention was non-pharmacological advice so excluded for this reason.

Zernike 1998 Randomised trial of structured patient-centred education programme versus normal information. Outcome patient knowledge which was increased and structured intervention. Excluded as no outcomes reported on blood pressure control or process of care.

van den Hoogen 1990 Non randomised study. "Experimental" study but no mention of randomisation. 15 general practices in the Netherlands, newly detected patients with hypertension two years prior to start of study aged 36-55 years. Intervention: computer-assisted monitoring system, provides monthly feedback on treatment results, regular meetings at practices where surveys discussed. Outcome: improved surveillance and control of blood pressure in computer group.
