UK

Introduction

People’s use of health services is influenced by a range of psychological, social, cultural, economic and practical factors. Eye care services are no exception. Nevertheless, there has been a tendency to assume that if eye services are available then people in need will use them, particularly if they are provided free of charge. This paper will focus upon the poor utilisation of services for the treatment of cataract in developing countries, and the reasons underlying this. The viewpoint examined will be that of the individual with an eye problem.

Levels of Cataract Surgery Up-take are Low

The effectiveness of prevention of blindness programmes is seriously weakened by the low levels of cataract surgery up-take. The WHO states that globally only a quarter of people in need currently use eye services.1 This is supported by evidence from studies conducted in India and Nepal which demonstrate levels of utilisation of eye services, and uptake of cataract surgery ranging from 7% to 35%.

A misleading impression of good utilisation is created by treatment centres which have a high patient demand. This overestimates the overall number of people presenting at treatment centres and the reasons underlying this. The viewpoint examined will be that of the individual with an eye problem.

Who Uses Cataract Services?

Typically eye service users are more likely to be male, live close to the treatment source, and possibly have higher literacy levels.2 It is not clear from current research if there are fundamental differences in the health beliefs of service users and non-users.

Reasons for the Poor Use of Eye Services

The main reasons for non-use of treatment services are inavailability, lack of knowledge, perceived need, and the lack of proper facilities for the treatment of eye problems.

Review Article:
Ignorance is not the principal problem modifying post-operative surgery. Cost in time and money, No escort. Post-operative recommendations put them off. Maintaining better service information, Behaviour is rational. This includes Distance. Lack of transport. Fear. It is well known that ‘bad news travels fast’. Treatment failures may unfortunately impact more upon community attitudes to eye treatment than all the examples of success.

Cost in time and money
Dealing with direct treatment costs has been a major concern of service providers. This is a very important obstacle to overcome. However, it is only part of the cost borne by service users and their families. The concept of ‘time is money’ is not only the preserve of the city professional. In fact it has a sharper reality for people living in poverty. Seeking treatment involves leaving day-to-day responsibilities. In an existence of ‘work today, eat today’ early treatment intervention is a luxury that may be unaffordable. Furthermore, costs are multiplied when other family members are involved, either to fulfil escort or carer roles.

Ageism
Unless actively addressed, there is scope for negative attitudes to old age to become a bigger barrier to treatment. Cataract is an age-related condition. Given demographic forecasts and life expectancy patterns, many of the people requiring surgical treatment will be women and widows. In many communities these are the people who are likely to be forgotten.

‘I don’t need treatment - I can manage’
To a greater or lesser extent, people report that they are coping and do not perceive a need for treatment/surgery. This includes bilaterally blind people too. This is somewhat surprising but possible explanations are that they have good adjustment to their disability with little evident handicap. On the other hand, this response may mask hidden barriers. After weighing up the explanation is not clear, and requires further exploration.

Conclusion
We need to raise awareness about the low use of cataract services, and adopt strategies which promote equality in eye service delivery, access and use. People who do not use eye services know why they do not seek treatment. It is therefore critical that providers ask and listen to the views of their community. Motivating potential treatment beneficiaries via health education, and social marketing strategies, such as the ‘aphakic motivator’, have been favoured strategies to improve cataract uptake. It would be a mistake to overlook the importance of social marketing but it is by no means a ‘magic bullet’. The test of time plus some evidence has shown that the power of example is not enough. The interplay between social, economic and cultural factors is key to understanding service utilisation, and to developing effective intervention strategies. Many of the reasons specified for poor service use are largely a consequence of poverty, gender inequality and lack of participation in decision-making. Tackling these causes is fundamentally challenging.

At a practical level we can begin by:

• improving the evaluation of cataract surgical outcomes.
• providing ‘fast track’ consultation and follow-up in the community.
• modifying post-operative surgery recommendations to facilitate a quick return to day-to-day responsibilities.
• promoting the benefits of cataract treatment for elderly people.
• maintaining better service information systems so that planners know who uses, and does not use their services.

Central to the success of these efforts is a move from an approach of ‘do unto communities’ to ‘do with communities’.

Acknowledgements
This article has been greatly influenced by other people, and my research experience in Tamil Nadu, India. Many thanks to the rural communities in Tamil Nadu who so readily shared their views with my colleagues and I from the London School of Hygiene & Tropical Medicine, Aravind Eye Hospital and SPEECH (a local NGO). A special thanks to Professor Astrid Fletcher who has given me the benefit of her expertise on countless occasions, and also made incisive comments on this article. Our research in Tamil Nadu was funded by the Department for International Development (UK Government).

Mobilising Resources Within the Community: ‘Mobilising the Unmobilised’

Muhammad Abdus Sabur
MBBS MCommH

Introduction
Every community has evolved ways of preventing and managing disease through a sound understanding of the causes of illness. Health care is provided at many levels by many different groups of people. These include mothers and family members, traditional practitioners and private and public health workers. The contact between people and health workers through an equitable health system can lead to better understanding of the choices available to the people in addressing their health needs. It also offers an opportunity to improve people’s health. At every level the capacity of people can be enhanced and the range of choices they have to protect their health problems can be increased.

Access to Health Care
Many people lack access to health care and also lack the basic health-related knowledge which would allow them to control their environment and/or their behaviour in the interests of their health. As a result, preventable and curative health conditions frequently lead to death or disability and, even when they do not, are a common reason for poor families becoming even poorer and without hope. Women and children face considerable additional difficulties in receiving health care, compared with men, and also are frequently allowed only limited participation in decisions concerning their own or their family’s health. This has a significant adverse effect upon their health and upon their health-seeking behaviour. The problem is not that solutions are unavailable, but rather providing these solutions to individuals and communities who require them.

• Using existing community resources
Health issues are social needs which cannot be fully met through exclusively medical approaches. Mobilisation and better use of existing resources (human, social and financial) can lead to a significant improvement in health. The aim should be to empower communities with basic health knowledge (preventive and basic curative), so that they can make better decisions with regard to their environment and their health. Empowering communities may be done by working directly with all sections of the community or through the existing groups/institutions or through selected volunteers. In Bangladesh, Save the Children (UK) worked with and through men, women and children of the project area (see below). The International Centre for Diarrhoeal Disease Research, Bangladesh (ICDDR,B), through its Chakoria project, worked through existing self-help groups (mosque committee, school committee, market committee, local youth clubs). Several government health care projects (Primary Health Care Intensification Project, Thana Functional Improvement Pilot Project) had experience of working through selected volunteers. The National Diarrhoea Control Programme and the Acute Respiratory Tract Infections Programme are working with the popularly known ‘Village Doctors’, demonstrated effective results. Also, the National Diarrhoea Control Programme and the Acute Respiratory Tract Infections Programme are working with them.

• Material resources
Material resources may also be mobilised within the community for health care. In Bangladesh, through philanthropic contributions (giving donations), several health facilities have been developed. If communities feel the need of health, they are willing and capable of arranging the resources required to deliver health care. The ICDDR,B’s Chakoria project has demon-
