SHORT COMMUNICATION

Prevalence of Type VI Secretion System in Spanish Campylobacter jejuni Isolates

Impacts

- Sixty three Spanish C. jejuni isolates (poultry and urban effluent) were investigated for presence of Type VI secretion system (T6SS) using whole-genome sequencing.
- The proportion of isolates harbouring all 13 T6SS ORFs was 14%.
- Further research would be necessary to determine the prevalence and importance of T6SS-positive C. jejuni strains.

Keywords:
Campylobacter; T6SS; virulence; Spain

Summary

Infections from Campylobacter jejuni pose a serious public health problem and are now considered the leading cause of foodborne bacterial gastroenteritis throughout the world. Sequencing of C. jejuni genomes has previously allowed a number of loci to be identified, which encode virulence factors that aid survival and pathogenicity. Recently, a Type VI secretion system (T6SS) consisting of 13 conserved genes was described in C. jejuni strains and recognised to promote pathogenicity and adaptation to the environment. In this study, we determined the presence of this T6SS in 63 Spanish C. jejuni isolates from the food chain and urban effluents using whole-genome sequencing. Our findings demonstrated that nine (14%) strains harboured the 13 ORFs found in prototype strain C. jejuni 108. Further studies will be necessary to determine the prevalence and importance of T6SS-positive C. jejuni strains.

Introduction

Campylobacteriosis is the most frequently reported zoonotic diarrhoeal disease worldwide with 80–90% of infections being attributed to Campylobacter jejuni (Humphrey et al., 2007; Fitzgerald et al., 2008; Epps et al., 2013; EFSA (European Food Safety Authority) and ECDC (European Centre for Disease Prevention and Control), 2014). Transmission of Campylobacter occurs throughout the food chain, often through cross-contamination (Epps et al., 2013). Consumption of poultry, beef and pork products is the leading cause of human foodborne illness, with poultry estimated to account for 50–70% of human Campylobacter infections (Jorgensen et al., 2002; Humphrey et al., 2007; Epps et al., 2013).

Recently, C. jejuni strains isolated from South-East Asia have been shown to harbour novel type VI secretion system (T6SS). T6SS are able to promote pathogenicity, symbiotic relationships and a selective adaptation to environmental perturbations (Jani and Cotter, 2010; Lertpiriyapong et al., 2012). The C. jejuni T6SS was found to have pleiotropic effects ranging from virulence, influencing cell adhesion, cytotoxicity towards erythrocytes and colonisation of mice (Lertpiriyapong et al., 2012; Bleumink-Pluym et al., 2013; Harrison et al., 2014). Current structural models of T6SS consist of a bacteriophage-like structure and a cell envelope-spanning membrane-associated assembly that translocates protein effectors into different cell types (Cascales and Cambillau, 2012; Silverman et al., 2012). A loci containing 13 ORFs can be subdivided into three groups; group one genes tssJ, tssL and tssM encode for membrane-associated proteins; group two genes tssB, tssC, tssD (hcp), tssE and tssI (vgrG) encode for proteins with function related to tailed bacteriophage components; group three genes tssA, tssF, tssG, tssH (tagH) and tssK encode for proteins with unknown function (Silverman et al., 2012; Fritsch et al., 2013).

Bleumink-Pluym et al., 2013 showed that of 80 investigated strains (which were predominantly from Europe or USA), only 10% harboured a T6SS. More recently a study compared the presence of T6SS in *C. jejuni* strains from the UK and Vietnam (Harrison et al., 2014), where T6SS was present in 60.6% and 71.4% of humans and chicken isolates respectively in Vietnam. However, in the UK, *C. jejuni* strains harbouring a T6SS from humans and chickens were noted as being 2.6% and 3.9%, respectively (Harrison et al., 2014). Given the difference between strains harbouring T6SS and the potential impact regarding strain virulence, we investigated the identification of T6SS loci within 63 Spanish *C. jejuni* strains isolated from poultry and urban effluents. The strains were isolated from a range of sources including faeces, neck skin, chicken meat and urban effluents. For the identification of T6SS in these *C. jejuni* isolates, whole-genome sequencing was performed.

**Materials and Methods**

**Sample collection**

*C. jejuni* were collected from poultry at various slaughterhouses and chicken meat from retail markets in Spain from 2010 to 2011. *C. jejuni* was identified from neck skin immediately after chilling, skinless breast meat at the end of the processing line and faecal content directly after evisceration (Ugarte-Ruiz et al., 2012). In addition, *C. jejuni* was also isolated from urban effluents at a sewage water treatment plant from 2010 to 2014. For this study, 63 *C. jejuni* strains were investigated from the food chain treatment plant from 2010 to 2014. For this study, 63 *C. jejuni* strains were investigated from the food chain which included 23 neck skin, 19 meat and 17 faecal isolates plus 4 isolates from urban effluents. Isolation and detection of *C. jejuni* was performed in Spain as described by Ugarte-Ruiz et al. (Ugarte-Ruiz et al., 2012). Genomic DNA (gDNA) was isolated using PureLink® Genomic DNA Mini Kit - Life Technologies (Grand Island, NY, USA).

**Genome sequencing, assembly and annotation**

Genome sequencing of all *C. jejuni* strains was performed using Illumina MiSeq 2 x 151 bp paired-end sequencing. Initial data quality was assessed in FastQC (Andrews, 2010). The sequencing reads were quality controlled using Trimmomatic (v0.32) (leading and trailing ‘trailing’ setting of 3, a ‘slidingwindow’ setting of 4 : 20 and a ‘minlenlength’ of 36 nucleotides) (Bolger et al., 2014). Reads were mapped using BWA-MEM (v0.7.7-r441) against the genome sequence of T6SS-positive *C. jejuni* 414 (CM000855) (Li and Durbin, 2009). Assembly was performed using VelvetOptimiser (v2.2.5) using n50 optimization (Zerbino and Birney, 2008; Gladman and Seemann, 2012). Contigs were ordered against *C. jejuni* 414 using ABACAS (v1.3.1) (Assefa et al., 2009). Annotation of genomes was performed with RATT (Otto et al., 2011) using *C. jejuni* NCTC 11168 (AL111168), *C. jejuni* 414 (CM000855), *C. jejuni* RM1221 (CP000025), *C. coli* 76339 (HG326877), *C. coli* CVM N29710 (CP004066), *C. concisus* 13826 (CP000792), *C. fetus* 82-40 (CP000487), *C. jejuni* 81-176 (CP000538), *C. jejuni* M1 (CP001900) and *C. lari* RM2100 (CP000932). Genomes were visualised using Artemis and act software (Carver et al., 2012). T6SS ORFs were identified using BLAST (Altschul et al., 1990; Gish and States, 1993).

**Results**

Using T6SS nucleotide and protein sequences from *C. jejuni* strain 108 (JX436460), the genomes of the 63 Spanish isolates were analysed to identify the presence of T6SS ORFs (Table 1). Our study identified 9 of 63 (14%) isolates harbouring all 13 T6SS ORFs. These strains were from faecal, neck skin and breast meat, whereas none of the isolates from urban effluents contained any T6SS ORFs (Table 1). A total of 51 of 63 (81%) strains did not include any T6SS ORFs and were considered as negative. Three isolates named as ZTA10/00846CPD PRESTON, ZTA10/02285CPF and ZTA10/02286CPF PRESTON (representing 5% of total sample number) did not contain the whole 13 T6SS repertoire, lacking 1, 5 and 10 ORFs respectively.

In addition to using the *C. jejuni* strain 108 T6SS ORF sequences to identify T6SS in the 63 Spanish isolates, we also used the T6SS from *C. jejuni* strain 414 (CM000855). The same T6SS ORFs were identified in the 63 Spanish isolates when using T6SS nucleotide and protein sequences from *C. jejuni* strain 414. The *C. jejuni* strain 414 genome was not annotated with a T6SS and so we used the *C. jejuni* strain 108 T6SS nucleotide and protein sequences to determined the location of the *C. jejuni* strain 414 T6SS ORFs (C414_000040085 (tssD), C414_000040087 (tssM), C414_000040089 (tssH), C414_000040090 (tssL), C414_000040091 (tssK), C414_000040092 (tssJ), C414_000040093 (tssA), C414_000040095 (tssB), C414_000040096 (tssC), C414_000040097 (tssE), C414_000040098 (tssF), C414_000040099 (tssG), C414_000040100 (tssI)).

**Discussion**

In this study, we found that the proportion of Spanish *C. jejuni* isolates containing all 13 T6SS ORFs was 14%, which is higher than data from previous studies that predominantly analysed strains from Europe and USA (Bleumink-Pluym et al., 2013; Harrison et al., 2014), but significantly below the rates in Vietnam (Harrison et al., 2014); noting that different sources and method for collection of samples have existed within the studies.
Table 1. T6SS from \textit{C. jejuni} strain 108 with the respective amino acid size and matches identified in the Spanish isolates. Negative results are not shown.
