What drives political commitment for nutrition? A review and framework synthesis to inform the United Nations Decade of Action on Nutrition

Phillip Baker,¹ Corinna Hawkes,² Kate Wingrove,¹ Alessandro Rhyl Demaio,³ Justin Parkhurst,⁴ Anne Marie Thow,⁵ Helen Walls⁶,⁷

INTRODUCTION

Malnutrition—‘an abnormal physiological condition caused by inadequate, unbalanced or excessive consumption of macronutrients and/or micronutrients’¹—is a leading driver of global death and disability. In 2014, 462 million adults were overweight, 2 billion micronutrient deficient and 1.9 billion overweight or obese.² In 2016, stunting (low height for age) affected 155 million children under 5 years of age, wasting (low weight for height) 52 million and overweight (high weight for height) a further 41 million.³ In 2011, nutrition-related factors contributed to 3.1 million or 45% of all deaths in children under 5 years of age.³ In short, malnutrition affects one in three people in the world and leaves no nation untouched.¹

The global nutrition situation is becoming more complex. Rapid nutritional change in many countries is precipitating a ‘double-burden’ of malnutrition, with high rates of undernutrition coexisting with overweight, obesity and diet-related non-communicable diseases (NCDs) within populations, households and individuals.¹,⁴ People who are malnourished are more likely to die younger, suffer disability, live in poverty, have impaired physical and cognitive development and reduced performance at school and work.¹ Conversely, good nutrition provides a bedrock for the economic and social development of nations; all of the Sustainable Development Goals both influence, and are influenced by, nutrition.

Global-level ambition for tackling ‘malnutrition in all its forms’ is strong. The declaration of 2016–2025 as the United Nations Decade of Action on Nutrition (the Nutrition Decade) and the positioning of nutrition within Sustainable Development Goal 2...
What is already known about this topic?

► Global-level ambition for tackling ‘malnutrition in all its forms’ is strong—the 2016–2025 United Nations Decade of Action on Nutrition (the Nutrition Decade) is testament to this.
► However, without political commitment at the country-level the policies, programmes and resources required to reduce and eliminate malnutrition in all its forms are unlikely to be adopted, effectively implemented and sustained.
► Recent advances in the political economy of nutrition literature reveal a complex web of factors that drive political commitment across different country contexts and forms of malnutrition. An in-depth understanding of these factors can inform strategic ‘commitment-building’ actions over the Nutrition Decade.

What are the new findings?

► In this review of the empirical nutrition policy literature, we ask the question: what factors generate, sustain and constrain political commitment for nutrition within countries, how and under what circumstances?
► Overall, 18 factors were identified and organised into five categories: actors; institutions; political and societal contexts; knowledge, evidence and framing; and capacities and resources.
► The identified factors were strongly interdependent and context-dependent, supporting the need to understand the drivers of political commitment within a non-linear and dynamic model of change.

How might this impact practice?

► Effective strategies for generating and sustaining political commitment over the Nutrition Decade are likely to involve a set of core actions but with some context-dependent adaptations.
► Ultimately, sustained actions by cohesive, responsive and strongly led nutrition actor networks with the strategic and organisational capacities for effective commitment-building are needed.
► Accelerating the development of such networks should be a core task for all actors involved, including international development partners.

(Met hod: the complex nature of political systems, the theoretically guided qualitative case study designs typically used in food and nutrition political analyses, and our aim of describing the multifactorial, interdependent and context-dependent drivers of political commitment rather than a simple description of listed variables.16 17 Such networks may be considered effective when they are capable of generating and sustaining rhetorical, institutional and operational forms of commitment, leveraging embedded commitments and ultimately achieving commitment that is system-wide.15

METHODS

Review method

We made several considerations in selecting the review method: the complex nature of political systems, the theoretically guided qualitative case study designs typically used in food and nutrition political analyses, and our aim of describing the multifactorial, interdependent and context-dependent drivers of political commitment rather than a simple description of listed variables. On this basis, we adopted a framework synthesis method16 17 suitable for reviewing qualitative research on applied policy topics, and adapted the Realist And Meta-narrative Evidence Synthesis: Evolving Standards (RAMESES) standards for reporting purposes.18 19

Defining political commitment

We adopt a definition of political commitment as ‘the intent and sustained actions over time by societal actors to achieve the objective of reducing and eliminating the manifestations and causes of (malnutrition)’.13 p282 Or more simply, it is ‘the will to act and keep on acting until the job is done’.7 pXIV From this perspective, achieving political commitment is more than generating attention to malnutrition or getting it onto a government agenda. It further involves the mobilisation of political systems and institutions, adopting policies, allocating resources and coordinating responses for as long as necessary to ensure results.7 9 15 16

Five inter-related forms of commitment can be identified in the literature on nutrition’s political economy (table 1). Commitment-building, the non-linear and dynamic process by which commitment is generated,7 occurs through the deliberate actions of nutrition actor networks—the individuals and organisations operating within a jurisdiction with a shared interest in attenuating malnutrition and who act collectively to do so.9 15 Such networks may be considered effective when they are capable of generating and sustaining rhetorical, institutional and operational forms of commitment, leveraging embedded commitments and ultimately achieving commitment that is system-wide.15

The achievement of [1] + [2] + [3] + [4] involving all actors operating within a nutrition system including communities, families and individual citizens. When achieved, system-wide commitment can create a powerful reinforcing feedback-loop that institutionalises and sustains long-term policy and programme responses. To be effective, efforts must be sustained and recalibrated in response to emerging opposition and demands, changing conditions and implementation challenges.}

### System-wide commitment

This involved formulating a theoretical framework of factors influencing political commitment and modifying it in response to extracted data to result in a revised framework including modified and new factors. We proceeded via five steps: (i) development of a framework integrating several theories on the determinants of political commitment; (ii) a search for relevant empirical literature; (iii) study selection and quality appraisal; (iv) extraction, analysis and synthesis of data and (v) population and modification of the framework. A review protocol was registered (PROSPERO 2016:CRD42016046015).

### Initial theoretical framework development

A scoping review of scholarly and grey literature was undertaken in July 2016 to identify relevant theories, to explicate the phenomena under study and identify search terms. To guide our initial conceptualisation and to guide the analysis, we drew on three complementary ‘middle-range’ theories often applied in the political economy of nutrition literature: Kingdon’s multiple streams theory, Shiffman and Smith’s health priority-setting framework and Heaver’s work on political commitment for nutrition. These were integrated into an initial theoretical framework (see online supplementary text 1).

### Search for relevant empirical literature

To optimise search strings, we undertook preliminary searches of the PubMed, Scopus, ProQuest and Web of Science databases using combinations of terms and database parameters (table 2). These databases were selected for their relevance and comprehensiveness after consultation with two librarians trained in systematic search. A search diary was kept to record progression and modifications to the protocol (see online supplementary text 2). We conducted a search for primary literature between August and October 2016. Acknowledging the large practice-orientated grey literature on the political economy of nutrition, we also searched the websites of international organisations with a mandate to address malnutrition in October 2016 (table 2). To capture studies missed in the initial search, additional searches were conducted in February 2017.

### Selecting studies and quality appraisal

References for all studies were entered into an EndNote library. Studies were selected against the inclusion and

Inclusion and exclusion criteria

Studies were included if:
1. Published after 1990 in English.
2. Published in a peer-reviewed journal or by an official organisation or non-government organisation with a mandate to address malnutrition.
3. Identified and described factors shaping political commitment for nutrition at national and/or subnational levels.
4. Involved an empirical analysis with clearly described aims, explicit use of theory or description of underlying assumptions, a clear study design and methodology including data sources, coherent statement of findings and justifiable conclusions.

Studies were excluded if:
1. Non-empirical (eg, commentaries, conceptual frameworks, calls to action).
2. Focused on specific institutional (eg, school, prisons and workplaces) or clinical policy-settings (ie, not at jurisdictional level).

*Truncated to capture all variations of the word (eg, “nutrition” captures malnutrition, overnutrition and undernutrition).

Figure 1  The search process.
exclusion criteria in table 2. Study quality was appraised by relevance to the review aim (inclusion criterion 3) and robustness (inclusion criterion 4). A diagram of the search process is given in figure 1. To check for inter-rater reliability, PB and KW independently screened a sample of records by title, abstract and full text (see online supplementary text 2). The final list of included articles was approved by all authors.

Data extraction, analysis and synthesis
Data were extracted in two steps. First, PB read all full texts and extracted the following basic data into an Excel (Microsoft) spreadsheet: study characteristics (authors, year, title, aims/objectives, policy focus, theory used, study design, methods, data sources, funding source); setting (local nutrition issue, geographical level, jurisdiction name, income-level); outcomes (study conclusions/key findings, commitment outcome). Second, studies were coded in ATLAS.ti (Scientific Software GmbH) using a coding schema derived from the initial framework and refined abductively using constant comparative analysis, whereby the coded concepts were confirmed, integrated, modified and/or added to through iterations of data analysis.21

Data were then synthesised. First, text associated with each code was read in situ by PB and summarised, including: (i) a definition of each factor, identified as what influenced commitment; (ii) the mechanism(s) associated with it, identified as underlying entities, structures or processes that transmitted a causal force between the factor and political commitment (either stated in the study or inferred);22 and (iii) cofactors that amplified, diminished and/or sustained the mechanism. On this basis, we defined ‘context’ as ‘underlying social, economic and physical phenomena’ influencing how the mechanism functioned to generate an outcome.23

Second, any cofactors missed in the first step were identified using the ATLAS.ti code cooccurrence tool.

Populating and modifying the framework
The synthesised data corresponding to modified or new factors were populated into the thematic categories of the framework to generate the final version.16 All authors reviewed iterations of the results and final tables.

RESULTS
Description of included studies
A total of 75 studies were included (see online supplementary text 3). There was an upsurge in publications per year in the 2006–2017 period, likely reflecting increased attention to nutrition’s political economy. By World Bank country income status, studies spanned 31 (38%) high-income (HICs), 13 (16%) upper-middle-income (UMICs), 22 (27%) lower-middle (LMICs) and 15 (18%) low-income (LICs) countries. By issue, 6 (8%) focused on food security, 22 (30%) on general malnutrition, 2 (3%) on micronutrient deficiencies, 28 (38%) on overweight/obesity and diet-related NCDs and 16 (22%) on undernutrition. Overweight/obesity and diet-related NCDs was the predominant focus in HICs and UMICs studies, and undernutrition in LMICs and LICs. Only one study explicitly focused on the double burden of malnutrition.

By jurisdictional level, 51 (68%) involved national jurisdictions, 17 (23%) subnational (region/province/state) and 4 (5%) subnational (local/municipal). A small number involved multilevel jurisdictions; 2 (3%) national and subnational (regional) and 1 (1%) national and supranational. Twenty-five frameworks, theories and models were identified across the included studies. Ten (14%) used the multiple streams theory, 9 (12%) a governance framework, 6 (8%) framing theory, 6 (8%) Shiffman and Smith’s framework, 5 (7%) Clark’s policy science framework, 4 (5%) the advocacy coalition framework and 4 (5%) the enabling environments for nutrition framework (6%). Twenty-four (32%) adopted a theoretically pluralistic approach that integrated two or more theories.

Factors generating, sustaining and constraining political commitment
As described in table 3, a total of 18 factors were identified as driving commitment, organised into five themes: actors; institutions; political and societal contexts; knowledge evidence and framing; and, capacities and resources. These were conceptualised as increasing or decreasing the probability of political commitment, rather than in terms of necessity or sufficiency.14 A more elaborate representation of these factors is given in online supplementary text 4, tables S4.1–S4.5. As demonstrated by the cofactors column in these tables, the determinants of commitment identified were dynamic, strongly independent and context-dependent.

Actors
Irrespective of country-context, effective nutrition actor networks (NANs) (factor 1) generated commitment through inter alia advocacy and awareness-raising, framing nutrition problems and solutions (ie, norm promotion), generating data and evidence, coordinating policy development, implementation and monitoring activities, building capacities and mobilising resources.24–47 Such networks varied widely in structure (formal vs informal), maturity (nascent vs highly evolved) and membership composition including parliamentarians, bureaucrats, academics, international agencies and civil society representatives.24–47 Their effectiveness was enhanced in the context of high cohesion among members,29 30 32 40–47 strong leadership44–46 and when possessing strategic and organisational capacities.25 29 37 43 48–50 Conflict and fragmentation within NANs was, however, frequently reported resulting from many topics of disagreement.12 25 28 33 34 36 40 51

Nutrition leaders (factor 2), including those within and outside of government enabled commitment in many studies through establishing, unifying and mobilising

| **Actors**                        | (1) Nutrition actor network (NAN) effectiveness: effectiveness of NANs, the individuals and organisations operating within a given jurisdiction who shared common principles, causal beliefs and/or interest in tackling malnutrition and who acted collectively to do so.  
(2) Strength of leadership: presence of committed and politically savvy individuals, within or outside of government, recognised as strong champions for nutrition.  
(3) Civil society mobilisation: extent to which civil society groups mobilised to address malnutrition, including non-government organisations and social movements collectively representing the interests of citizens.  
(4) Supportive international actors: degree to which actors with an international scope of operations and/or membership initiated, championed and/or supported nutrition policy and programming responses.  
(5) Private sector interference: degree to which mobilised private interest groups undermined effective nutrition policy responses, including food producers, retailers, marketers and their representative peak bodies. |
| **Institutions**                  | (6) Strength of institutions: extent to which coordinating agencies and institutional systems mandated to address malnutrition were empowered to effectively coordinate multisector/multilevel responses and advocate for sustained attention and resources.  
(7) Effective vertical coordination: degree to which nutrition policies were effectively coordinated, implemented and monitored across levels of governance, particularly regarding the incentives of subnational actors to adopt, progress and benefit from central government policies.  
(8) Legislative, regulatory and policy frameworks: degree to which national nutrition policies, operational plans and enabling legislation were well-designed and enacted, and/or the alignment of nutrition objectives with broader policy agendas and regulatory frameworks. |
| **Political and societal contexts**| (9) Supportive political administrations: degree to which members of the executive (eg, head of state, ministers), legislative (eg, parliamentarians) and administrative (eg, agency heads, senior officials) branches of government initiated and championed nutrition responses.  
(10) Societal conditions and focusing events: extent to which changing societal conditions (long-duration phenomena) or focusing events (short-term processes) focused attention onto nutrition or closely related issues and presented opportunities or impediments to commitment-building.  
(11) Ideology and institutional norms: extent to which entrenched belief systems and practices predominant within political systems, policy-making institutions and/or in society-at-large, negatively skewed perceptions about malnutrition problems and undermined effective policy responses. |
| **Knowledge, evidence and framing**| (12) Credible indicators and data systems: availability of credible indicators and high-quality data systems for monitoring nutrition problems, informing policy design, tracking progress and empowering accountability systems.  
(13) Evidence: extent to which robust evidence on the causes, manifestations and consequences of malnutrition and the efficacy and cost-effectiveness of interventions was available, clearly communicated and accepted.  
(14) Internal frame alignment: degree to which NANs were aligned around a common interpretation and narrative of a given malnutrition problem including its definition, magnitude, causes and solutions for resolving it.  
(15) External frame resonance: degree to which NANs publicly portrayed (ie, framed) nutrition problems and solutions in ways that resonated with and motivated action by external audiences, and countered the frames deployed by opponents. |
| **Capacities and resources**       | (16) Strategic capacities: degree to which NAN members possessed ‘soft-power’ skills including the capacity to generate consensus, resolve conflicts, respond to recurring opportunities and challenges, build strategic alliances, undertake strategic communications and related tasks.  
(17) Organisational capacities: degree to which NAN members possessed the technical knowledge and skills, administrative systems and human resources required to generate commitment, including through the effective management of nutrition policy and programming responses.  
(18) Financial resources: degree to which nutrition budgetary commitments and financing systems incentivised multisector/multilevel coordination, ensured successful policy implementation and created ownership and entitlements among political elites, policy-makers, citizens and other stakeholders. |
NANs, championing policy ideas and engaging with decision-makers. They included advocates promoting external attention to nutrition, policy entrepreneurs (eg, who softened-up technical communities to political realities, built consensus and advocated policy ideas) and high-level political champions. Their leadership was enhanced when possessing certain strategic capacities (eg, emotional intelligence, management, communication, negotiation and conflict management skills), they had the support of high-level political champions, and when elected or appointed into positions of authority (eg, as legislators or high-level bureaucrats).

The mobilisation of civil society groups (factor 3), including a diversity of international and national non-governmental organisations and social movements (eg, health-orientated, disease-specific, faith-based, consumer-focused), was often integral to NAN formation, development and impact. Groups varied in their expertise, available resources and functional roles. Their activities included advocacy, awareness-raising and coalition-building, acting as an accountability mechanism (eg, by monitoring and reporting on government and other stakeholder activities), giving voice to the politically marginalised, delivering on-the-ground services and informing policy development, monitoring and calibration.

Civil society impact was enhanced when supported by the media, international actors, and when inclusive governance arrangements linked policy-makers with civil society groups and policy beneficiaries.

In several LIC and MIC studies, supportive international actors (factor 4) enabled commitment by mobilising resources for policy, programming and capacity-building, providing technical assistance and legitimacy to policy initiatives, and by advocating to governments. They included multilateral organisations (eg, World Health Organization, Unicef, World Bank), donor agencies (eg, United States Agency for International Development, United Kingdom’s Department for International Development) and global nutrition initiatives (eg, Scaling Up Nutrition). In some cases, policy and programming was almost entirely donor-driven. The role of international actors was weakened when their actions were misaligned with government priorities, when the absence of coherent government policies, coordinating structures and accountability mechanisms encouraged donors to ‘go it alone’ and when recipient governments became overdependent on donor financing.

In many MIC and HIC studies, private sector interference (factor 5) impeded commitment for food regulations targeting obesity prevention by undermining policy debates (eg, by emphasising individual or parental responsibility, disputing evidence, intervention as ‘nanny-statist’), pre-emptively adopting self-regulation (ie, policy substitution) and direct lobbying of policy-makers. This was enhanced in the context of a neoliberal ideology including a shift towards hybrid (ie, public-private) governance arrangements that expanded private-interest influence in public policy, the food industry’s ‘productivist power’ as suppliers of jobs and tax revenue and greater international capital mobility (ie, via trade liberalisation) allowing transnational corporations to punish or reward governments for their policy decisions.

In some LIC and MIC studies, agricultural subsidies, tax concessions and ‘pork-barrelling’ may have created powerful private-interest constituencies resisting nutrition-sensitive agriculture and food distribution policy change.

Institutions

Tackling malnutrition requires coordinated action and commitment within and across multiple sectors (horizontal coordination) and levels (vertical coordination) of governance. The complex institutional arrangements involved, the absence of institutional ownership for nutrition, and institutional failure often impeded this. The establishment of empowered coordinating agencies and institutional systems with a mandate to address malnutrition (factor 6) was important in overcoming these challenges through providing structures for convening stakeholders, coordinating multisector/multilevel policy development, implementation and monitoring activities and mobilising human, technical and financial resources. This often centrally involved the health and agricultural sectors, but also inter alia education, gender, labour, finance, economic development, industry, water and sanitation, social protection and trade.

Coordinating agencies were typically located within suprasectoral agencies (eg, office of the prime minister) or line agencies (eg, ministry of health, agriculture) and embedded within wider multisector/multilevel institutional systems with delineated roles and responsibilities. Agencies were more often effective when positioned suprasectorally and possessing sufficient capacities, resources and leadership and when institutional systems had strong multisector/multilevel cooperation incentives (eg, enabling legislation, policies and plans, shared and sector-specific goals, performance measures and performance and/or results-based budgeting systems).

Institutional failure resulted from insufficient authority, capacities and resources (often when located within politically weak line ministries) an overfocus on technical or implementation activities to the neglect of advocacy and interorganisational competition. Vertical coordination presented a significant challenge given the many actors involved in policy and programming activities within and across levels of governance.
actions, building ownership and driving coordinated action along national to subnational ‘implementation pathways’. This was enhanced through strong cooperation incentives (eg, legislation requiring multilevel cooperation, resource transfers and performance and/or results-based budgeting), and subnational institutional structures with sufficient capacities and resources.

Decentralisation processes underway in many countries increased the power of subnational stakeholders, making their involvement in centralised policy processes critical, and their exclusion detrimental. In some cases, decentralisation also undermined the authority of centralised coordinating agencies.

The development and adoption of national nutrition policies, operational plans and enabling legislation (factor 8) enabled commitment by demonstrating accountabilities to which governments could be held accountable, enabling beliefs on the need for coordinated action within government, and by providing a framework for action. Commitment was further enhanced when nutrition was positioned within broader national development plans, social welfare reforms and/or poverty reduction strategies, when global-level policies and/or commitments compelled national governments to initiate responses, and when policies had clear numerical commitments that enhanced accountability. It was diminished when nutrition was excluded or marginalised from broader policy agendas, and when there was limited capacity to achieve consensus among stakeholders during policy processes.

Political and societal contexts

Political administrations, including the executive, legislative and administrative branches of government were often the primary power structures shaping nutrition responses at all levels. Supportive political administrations (factor 9) enabled commitment by articulating policy debates, championing policy initiatives, facilitating inclusive policy processes (eg, public consultations), drafting policy and legislation, providing institutional memory and enhancing accountability through oversight of policy initiatives, agencies and expenditures. This was more likely with the election or electoral continuity of governments with strong social welfare and anti-poverty agendas, when actions were taken to build non-partisan (ie, multiparty or multifaction) coalitions for nutrition and when parliamentarians were actively involved in policy processes.

Unsupportive political administrations were frequently reported. In several cases, rhetorical commitments by members of the executive branch were not converted into directives for legislative and administrative enactment. This was more likely in the context of weak electoral demand and/or civil society pressure (ie, reducing the political costs of inaction), the low-level visibility of nutrition and poor nutritional literacy among parliamentarians, administrators and citizens, when attention to nutrition was eclipsed by more tangible ‘vote-winning’ issues, and in highly partisan, fragmented or unstable political environments.

Long-term changes in societal conditions and short-term focusing events (factor 11) presented opportunities or challenges for generating commitment by influencing many aspects of government policy agendas and by focusing public and political attention directly onto or away from nutrition and/or closely related issues.

Examples of these are given in table 4. Some focusing events (eg, famines) were detrimental when they focused attention onto and institutionalised food production and distribution responses at the expense of broader (ie, nutrition-sensitive) and longer-term responses to undernutrition. Changing societal conditions and focusing events were more likely to advance commitment when NANs had sufficient foresight, leadership and capacities to take advantage of emerging opportunities or mitigate threats.

Certain belief systems (factor 12) entrenched within political systems, policy-making institutions and/or in society-at-large were found to narrow or skew perceptions about the scale, scope and nature of nutrition problems, thereby impeding commitment for more balanced policy responses addressing the wider determinants of malnutrition.

Four were most evident as described in table 5. In primarily HIC studies, a ‘neoliberal ideology’ was found to skew overweight/obesity responses towards dietary/lifestyle and market-driven (ie, industry-led) approaches with a limited role for government and legislative intervention. In several LIC and MICs, a ‘food-centric’ belief system was found to orientate policy responses towards agricultural production, food distribution and hunger reduction to the exclusion of nutrition. A ‘nutricentric’ belief system skewed undernutrition responses towards nutrition-specific and/or curative/biomedical interventions to the neglect of nutrition-sensitive ones.

Knowledge, evidence and framing

Irrespective of issue or country-context, the availability of credible indicators and data systems (factor 12) was critical to enabling commitment by informing problem identification (ie, demonstrating the changing prevalence and distribution of malnutrition), policy development, monitoring and calibration activities, the development of internal frame alignment (ie, a shared discourse) within NANs, and as a foundation for effective financing and accountability systems.

Data demonstrating ‘policy success’ enabled successful advocacy efforts for sustaining long-term commitment.
reported in many studies, often resulting from the limited capacities, resources and incentives of nutrition actors to collect, analyse and disseminate data. Evidence demonstrating the causes and consequences of malnutrition and the efficacy and cost-effectiveness of interventions (factor 13) helped to support effective advocacy and policy activities when available, clearly communicated and accepted. This was more likely when evidence was communicated via ‘knowledge-brokers’ in language policy-makers understand, by using communicative devices (eg, reported in many studies, often resulting from the limited capacities, resources and incentives of nutrition actors to collect, analyse and disseminate data. Evidence demonstrating the causes and consequences of malnutrition and the efficacy and cost-effectiveness of interventions (factor 13) helped to support effective advocacy and policy activities when available, clearly communicated and accepted. Evidence demonstrating the causes and consequences of malnutrition and the efficacy and cost-effectiveness of interventions (factor 13) helped to support effective advocacy and policy activities when available, clearly communicated and accepted. This was more likely when evidence was communicated via ‘knowledge-brokers’ in language policy-makers understand, by using communicative devices (eg,
country profiles, short briefs, nutrition maps, and when authoritative bodies were commissioned to gather, integrate and report evidence. The perception that evidence was lacking, inconsistent or unconvincing was frequently reported. Although in some studies a strong international evidence-base supported country-level activities, many reported an absence of locally relevant evidence and/or the perception that international/national evidence was inapplicable to national/subnational contexts.

Higher evidential requirements were needed to inform policy decisions when issues were strongly contested, as in the case of food regulations targeting obesity prevention. NANNs that were unified around a common problem definition, causal interpretation and set of proposed solutions (factor 14) were more likely to overcome ideological differences, appease powerful ‘veto players’ and undertake effective collective action. This was more likely when NANNs had established structures (eg, governance bodies, conferences, workshops, informal networking events) for sharing information, recruiting and socialising new members, building consensus and managing conflicts, and at the institutional level the capacity to align with the priorities, interests and needs of target audiences.

NANNs’ strategic capacities (ie, soft skills) for building consensus and managing conflicts and credible data, evidence and/or a shared causal framework (eg, Unicef nutrition framework) to support a unifying discourse. The failure to achieve this ‘internal frame alignment’ was reported in many cases and resulted more often from normative conflicts (eg, divergent interests, organisational mandates, administrative systems or professional cultures) rather than technical ones. Although there were many topics of disagreement within NANNs, distrust and disagreement regarding the private sector’s role in nutrition policy was most common.

Certain public portrayals (ie, frames) used by nutrition actors to attribute causality, responsibility, severity, tractability and benefit to an issue were found to resonate strongly with external audiences and thus enable commitment. Common frames identified are described in table 6. This ‘external frame resonance’ (factor 14) was more likely when messages were aligned with the underlying values and beliefs of policy decision-makers, including their perceptions of technical and political feasibility, when NANNs argued behind closed doors and spoke with a common voice and when messages were strategically tailored to align with the priorities, interests and needs of target audiences.

### Capacities and resources

NANNs possessing strategic capacities (factor 16), described as ‘a body of craft knowledge with considerable practical utility’ were more capable of building cohesive NANNs, responding to opportunities and counteracting threats, and managing complex political and policy processes. At the individual level, this included certain attributes of nutrition leaders (see factor 2) and at the institutional level the capacity for building consensus, managing conflicts and developing competencies, establishing and maintaining strategic multistakeholder partnerships (ie, coalition-building) and undertaking strategic communication. The latter included the capacity to negotiate, compromise and tailor messages to different audiences, advocate for incremental/realistic changes aligned with decision-maker priorities and to use champions with direct access to policy-makers. In several studies, weak strategic capacities were reported as problematic.

Limited organisational capacities (factor 17) frequently undermined commitment by constraining

the effective management of nutrition policy responses and increasing the likelihood of policy failure (thus trapping nutrition within a low-priority cycle). This was most evident in cases where competent nutrition professionals and administrative staff were lacking, especially at the local level.\(^4\) 44 49 42 43 46 52 61 63 67 70 72 86 91 95 when there was a high turnover of ministers or administrative staff and/or disruptive administrative restructuring.\(^2\) 24 42 44 61 69 58 63 68 70 72 95 99 limited technical capacities particularly for multisectoral/multilevel data collection, management and analysis,\(^4\) 40 42 52 61 69 72 93 when high administrative loads were placed on weak coordinating agencies and other relevant institutions\(^3\) 38 48 52 55 63 68 70 72 and when absent or weak budgeting, record-keeping and accounting capacities undermined financial planning, programming efficiency and accountability.\(^8\) 52 63 68 70 92

The expansion of nutrition budgetary commitments and effective financing systems (factor 18) enabled commitment by empowering coordinating agencies and institutional systems, enabling effective policy implementation, and by creating entitlements among parliamentarians, bureaucrats and citizens.\(^2\) 27 52 53 66 67 71 48 52 61 62 72 93 Performance and/or results-based budgeting was effective at incentivising multisector/multilevel cooperation, improving the transparency and accountability of institutional systems and enhancing the efficiency of programming activities.\(^2\) 27 29 32 53 66 More generally, accountability was enhanced when there were transparent financing and accounting systems for tracking disbursements.\(^8\) 48 52 61 72 93 In many cases, inadequate financial resources or the failure to effectively use existing resources led to poor implementation outcomes and policy failure.\(^2\) 24 38 40 42 43 48 48 52 61 63 67 68 70 72 90 91 93 Financing activities were undermined by a limited capacity of subnational implementation partners to use or reciprocate funding from central government,\(^1\) 12 52 62 the absence of nutrition line items in government budgets or the nesting of nutrition within budgets for non-mandated departments or issues\(^6\) 65 67 72 and when siloed financing arrangements encouraged interagency competition and disintermediated cooperation.\(^2\) 24 38 40 48 60 93

DISCUSSION

We used a theoretically driven review method to identify the determinants of political commitment for nutrition at the country-level. Overall, we identified and described 18 factors organised into five themes: actors; institutions; political and societal contexts; knowledge, evidence and framing; and, capacities and resources. Many of the identified factors have been described previously in the literature on nutrition’s political economy.\(^7\) The results affirm the findings of reviews on undernutrition in low-income and middle-income countries,\(^8\) \(^9\) \(^12\) and on nutrition and obesity in middle-income and high-income countries.\(^1\) 19 97

Similar themes have been found in global and supranational studies.\(^8\) \(^8\) 98 We have, however, extended this work in two notable ways.

First, we integrated the nutrition politics and policy literature relevant to ‘malnutrition in all its forms’, thus spanning all issues and country-contexts. Although the included studies were not always directly comparable (due to differences in study design, theoretical focus and methods used), many of the determinants of political commitment were similar across issues and contexts. Irrespectively, effective nutrition actor networks, strong leadership, civil society mobilisation, supportive political administrations, changing societal conditions and focusing events, cohesive and resonant framing, and data systems and evidence were commitment drivers.

There were some notable exceptions, likely reflecting the focus of distinct bodies of researchers working in different country-contexts. For example, factors within the ‘institutions’ and ‘capacities and resources’ themes were almost exclusively reported in low-income and middle-income country studies, although these are very likely to be important in high-income countries. Private sector interference was reported as impeding policy responses to obesity and diet-related NCDs exclusively in upper-middle-income and high-income countries. Nonetheless, these findings suggest that addressing malnutrition in all its forms is likely to require some core types of commitment-building activities, but with some context-dependent adaptations.

Second, previous reviews have listed and described relevant factors but have neither elaborated on their interactions nor elaborated significantly on the role of context. Our results demonstrate that the determinants of political commitment for nutrition are strongly interdependent, context-dependent and dynamic, thus demonstrating systems-like features. This supports the need and provides a foundation for understanding the drivers of political commitment, and arguably the political economy of nutrition more generally, within a non-linear and dynamic model of change.\(^8\) Qualitative system-dynamics modelling could be used to generate such a model and elaborate on the functioning of ‘food and nutrition political economy systems’. In this perspective, the effects of interactions among factors are likely to be significantly greater than the sum of their individual effects in isolation.\(^9\)

Future research directions

Although in recent decades a rich and growing literature on the political economy of nutrition has emerged, many evidence gaps remain. In this section we explore a number of these.

Theoretically, the broad repertoire of frameworks, theories and models used across the literature has provided multiple lenses through which to understand this complex topic. Arguably, studies using comprehensive and theoretically pluralistic frameworks\(^8\) \(^9\) \(^15\) \(^20\) \(^38\) have generated deeper insights into the functioning of food and nutrition political economy systems as a whole, than those focused on certain facets (eg, framing) or policy process stages (eg, agenda-setting). Overall, we found
the theory-driven framework synthesis method well suited to our aim of understanding a complex political phenomenon. However, empirical evidence in theoretically guided research is always generated, at least to some extent, by the theory itself. Thus, we may have missed important drivers of political commitment because they have been undertheorised and thus under-reported in the literature. Indeed, important approaches in political science (eg, new institutionalism) are largely absent and provide avenues for guiding future investigation.

Substantively, there are many research questions in need of answers of which some—given their cross-cutting nature—are arguably most important. Several concern nutrition actor networks. How do such networks form, evolve and become effective? What pragmatic actions can be taken to rapidly enhance their effectiveness within countries? Several institutionalised belief systems (eg, food-bias, nutricentrism) are strong commitment barriers. Why have these become institutionalised in some jurisdictions but not others? How might these be countered? Very few studies have focused on the reality that NANs concerned with obesity tend to be different to those concerned with undernutrition. What opportunities does bringing together people and entities concerned with different forms of malnutrition present for furthering commitment to nutrition, especially as new institutional systems and policies for tackling overweight/obesity and diet-related NCDs are layered onto existing ones for undernutrition? The role of parliamentarians is also underexplored.52 How can non-partisan support for nutrition be attained and sustained more systematically at this level? Private sector interference is reported to have strongly impeded commitment for overweight/obesity and diet-related NCD prevention. How can NANs more effectively counteract this interference, while recognising that the private sector will inevitably have to be involved in delivering on objectives?

CONCLUSION

In this review we asked: what factors generate, sustain and constrain political commitment for nutrition at national and subnational levels, how and under what circumstances? Our aim was to inform strategic actions for building commitment over the United Nations Decade of Action on Nutrition. Overall, 18 factors were identified organised into five themes: actors; institutions; political and societal contexts; knowledge, evidence and framing; and, capacities and resources. The results demonstrate that the processes driving commitment are multifactorial, dynamic and strongly context-dependent. Furthermore, commitment is not something that simply exists or emerges accidentally; it can be created and strengthened over time through strategic action.9

Many of the divers of political commitment are similar irrespective of country-context or nutrition issue, but with some notable exceptions. This suggests that effective commitment-building strategies are likely to involve a set of core actions but with some context-dependent adaptations. The main core action identified through this study is sustained commitment-building actions by cohesive, responsive and strongly led nutrition actor networks. Accelerating the development of such networks should be a core task for all actors involved, including international development partners. To achieve their goals, nutrition actor networks should aim to enrol the support of political leaders, parliamentarians and administrative elites and mobilise civil society coalitions. To sustain commitment, they must establish empowered institutions, develop organisational and strategic capacities, generate commitment among implementation partners at all levels and mobilise the financial resources to do so.

Contributors PB, CH and ARD proposed the idea for the review. PB developed the review protocol with input from all authors. PB and KW undertook the systematic search with final approval of included studies by all authors. PB extracted the data including coding of the included studies, analysed the data with input from KW and wrote the first draft of the manuscript. All authors provided input into the interpretations of the results and ongoing iterations of the manuscript. All authors approved the final version.

Funding Funding for the development of this paper was provided by the Department of Nutrition for Health and Development, WHO, Switzerland.
