Email: Basil.Aboul-Enein@lshtm.ac.uk

Abstract

The increasing global prevalence of obesity and obesity-related co-morbidities has prompted calls for culturally-congruent dietary patterns and health-promoting strategies and interventions appropriate for specific populations and communities. The Holy Quran is viewed as the primary behavioral and religious guidance for all Muslims around the world. Diets rich in plant-based foods and its protective role in the reduction and prevention of obesity-related diseases have been established. The purpose of this study is to examine passages cited in the Holy Quran with particular reference given to plant foods cited and features of a plant-based diet. A narrative review of the Holy Quran in two formats was conducted to identify plant-based foods. A total of 36 passages were identified in this review with a considerable focus on the consumption of dates, olives, grapes, whole grains, pomegranates, and other plant-based foods. This review supports the Holy Quran as an authoritative culturally-relevant faith-based resource for dietitians, public health educators, and other health professionals operating in Muslim populations and communities around the world to promote dietary patterns rich in fruits, vegetables, and whole grains.

Keywords: Religion; Health; Nutrition; Cultural competence

Introduction

According to the World Health Organization (WHO), over 1.9 billion adults, 18 years and older, were overweight (Body Mass Index [BMI] between 25–29.9) and of these adults, over 600 million were obese (BMI 30-39.9) in 2014 (World Health Organization, 2016b). As global obesity trends and obesity-related co-morbidities such as type 2 diabetes mellitus, hypertension, cardiovascular disease, stroke, and some cancers continue to increase unabated (Ng et al., 2014; World Health Organization, 2016b), global public policies and awareness campaigns have prompted calls from the WHO for action to reduce obesogenic environments and promote beliefs and attitudes that could support healthy dietary patterns and encourage physical activity (World Health Organization, 2016a). Recent studies have placed an emphasis on the importance of health strategies and interventions that are culturally-relevant and tailored to various respective populations and communities (Bender, Nader, Kennedy, & Gahagan, 2013; Bertran et al., 2015; James, Pobee, Oxidine, Brown, & Joshi, 2012; Kim, Song, Han, Kim, & Kim, 2013). Additionally, theoretical frameworks that incorporate aspects of faith and religion within culturally-tailored interventions have been previously proposed and continue to gain growing recognition for their potential
to influence health beliefs and behaviors (Grundmann, 2014; Lancaster, Carter-Edwards, Grilo, Shen, & Schoenthaler, 2014; Opalinski, Dyess, & Grooper, 2015; Sattin et al., 2016; Yeary et al., 2015). In the predominately-Muslim Arab countries of the Middle East and North Africa (MENA), the current prevalence of overweight and obesity ranges from 74-86% and 69-77% in women and men, respectively (World Health Organization Regional Office for the Eastern Mediterranean, 2016). Given that Muslim communities in MENA and around the world are not immune from the widespread public health problems associated with obesity and poor dietary patterns, some recent studies have begun offering faith-based tailoring applicable to Muslim populations as it relates to healthy dietary patterns and physical activity (Aboul-Enein, 2015, 2016; Ghadimi, Kamrani, Zarghami, & Darzi, 2013; Peyravi & Moezzi, 2013; Tarighat-Esfanjani & Namazi, 2016).

Among the evidence-based healthy diets proposed, diets rich in plant-based foods have been regarded as among the healthiest of diets comparable to the Mediterranean-style diet (MD) (Preedy & Watson, 2015; Tuso, Ismail, Ha, & Bartolotto, 2013). Broadly defined, the general dietary principle behind the plant-based rich diet is to maximize consumption of nutrient-dense plant foods from fruits, vegetables, legumes, and whole grains while reducing the consumption of calorie-dense nutrient-poor foods characterized by refined sugars, saturated fats, and processed foods (Tuso, Stoll, & Li, 2015). Previous studies have shown that a plant-based rich diet can be an effective treatment and prevention of obesity and obesity-related conditions (Campbell II & Colin Campbell, 2013; Macknin et al., 2015; Matada, Philippe, & Koneri, 2013; Newby, 2009; Pistollato & Battino, 2014; Turner-McGrievy & Harris, 2014).

The purpose of this narrative study is to review and reflect public health perspectives of dietary patterns focused on fruits, vegetables, and whole grains with special reference given to passages from the Holy Quran as a cultural-congruent faith-based approach to help address the growing obesity pandemic with particular attention given to Muslim populations and communities in MENA and around the world. This review adds value for several reasons. Firstly, there is notable growth in the number of studies (Cong et al., 2014; Kalter-Leibovici et al., 2010; Ludwig, Cox, & Ellahi, 2011) that help elucidate the growing obesity crisis facing Muslim populations and communities around the world. Secondly, given the current obesity crisis facing Muslim populations and communities, this review could lead to a better culturally-relevant understanding of the current and future status of obesity-related strategies and interventions among Muslim populations and communities. Lastly, addressing healthy dietary patterns to prevent and reduce obesity and obesity-related mortality and morbidity is an essential topic on the world health agenda. Therefore, developing foundations for culturally-congruent public health nutrition priorities and interventions relevant to Muslim populations in the MENA region and around the world is warranted.

**Methodology**

The Holy Quran is regarded as the divinely inspired authoritative word of the Divine. It is divided into 114 Surah (Chapters) and 6236 ayah (passages). A narrative examination of the Holy Quran was carried out using both electronic and hard copy formats (The Holy Quran, 2016; The Noble Quran, 1993) in order to examine and compare the accuracy and translation of each respective passage. Both formats were narratively reviewed for content that cite plant-based foods. All passages were translated to the English language and tabulated by citation and plant-based food cited in each respective passage (Table 1). The King Fahd Complex for the Printing of the Holy Quran and the King Saud University Electronic Moshaf Project provided English translations for this review. Given the nature of this study, no ethical standards were necessary and, therefore, no ethical review board was required. Additionally, the author wishes to assure Islamic religious authorities that there is no infringement upon theology and no declaration of a dogma pertaining to this review of the Holy Quran.
Results

A total of 36 passages out of 6236 total passages and 21 chapters out of 114 total chapters were identified in this review. The most commonly cited plant-based food was dates [15], followed by grapes [12], olives or olive oil and whole grains [8 each], pomegranates [3], mustard seeds [2], and cucumbers, wheat, garlic, lentils, onions, bananas, corn, herbs, pumpkin, and figs [1 each]. Of the 21 chapters identified in this review, one chapter was titled The Fig.

Whole grains; Dates
Surat Qaf (The Letter Q) 50:9-10
“And We have sent down blessed water from the sky and made grow thereby gardens and grain (every kind of harvests) reaped. And lofty date palm trees having fruit arranged in layers.”

Whole grains
Surat Al-An’am (The Livestock) 6:95
“And We send down from the sky rain charted with blessing, and We produce therewith gardens and Grain for harvests.”

Olives (Olive oil); Grapes
Surat Yusuf (Joseph) 12:49
“Then will come after that a year in which the people will be given rain and in which they will press [olives and grapes].”

* As applicable to the respective passage

Discussion

Referred to as the ‘Biblical Seven’ species (Berry, Armoni, & Aviram, 2011; Preedy & Watson, 2015) and comparable to plant-based foods cited in the Bible (Janick, 2007), plant-based foods identified in the Holy Quran and their nutritional benefits have been elucidated in previous literature (Azarpour, Moraditochaee, & Bozorgi, 2014; Salem et al., 2009; Shafighat, 2010). Phytochemical analysis show these foods to be rich sources of flavonoids (Shafighat, 2010). Previous studies (Galleano et al., 2012; Hossain et al., 2016; Hurt & Wilson, 2012) continue to support flavonoid-rich foods and their protective mechanisms for preventing and reducing obesity and obesity-related diseases. Evidence regarding the dietary potential found in dates (Phoenix dactylifera), grapes (Vitis vinifera), olives and olive oil (Olea europaea), pomegranates (Punica granatum), and whole grains have been well established in the literature (Al-Muammar & Khan, 2012; Cho, Qi, Fahey Jr, & Klurfeld, 2013; Chuang & McIntosh, 2011; Mallhi et al., 2014; Pérez-Martínez, García-Ríos, Delgado-Listo, Pérez-Jiménez, & López-Miranda, 2011). Moreover, the positive and synergistic effects of Mediterranean-style dietary patterns composed of both plant-based dietary fiber and monounsaturated fatty acids, primarily from olive oil, has been suggested in previous evidence (De Barros et al., 2014; Jacobs & Tapsell, 2013; Martínez-González & Gea, 2012). The MD has been previously proposed as an environmentally-friendly diet model defined by its sustainability and biodiversity (Burlingame & Dernini, 2011; Sáez-Almendros, Obrador, Bach-Faig, & Serra-Majem, 2013; Serra-Majem, Bach-Faig, Miranda, & Clapes-Badrinas, 2011). Given that plant-based foods cited in the Holy Quran share common ‘food denominators’ with the MD, it stands to reason that a diet congruent with the Holy Quran would serve as an equally novel culturally-relevant diet model characterized by its biodiversity and sustainability. Interestingly, the United Nations Educational, Scientific and Cultural Organization (UNESCO) proposed in establishing a botanical garden in Doha, Qatar, which the primary feature of this project, titled the ‘Quranic Botanic Garden,’ is to promote the cultural heritage and knowledge of Quranic plants for scientific, conservational, and aesthetic purposes (Qatar Foundation, 2016; United Nations Educational Scientific and Cultural Organization, 2009). One of the educational objectives of this project is to highlight the nutritional potential found in Quranic plant foods. Recent literature (Aboul-Enein, 2016; Ghadimi et al., 2013; Hussain, 2013; Owens & Sami, 2015) has proposed the beneficial and health-promoting potential of the Holy Quran as a culturally congruent resource intended for Muslim populations. Therefore, public health nutrition professionals and medical anthropologists could use the food-oriented text and

*The Quranic Garden*: Consumption of Fruits, Vegetables, and Whole Grains from an Islamic Perspective
passages to appropriately inform dietary advice to members of Muslim communities.

Conclusions

Given the global obesity crisis, particularly facing the predominantly-Muslim countries in MENA and other Muslim communities around the world (Aboul-Enein, Bernstein, & Neary, 2017; Cong et al., 2014; Ludwig et al., 2011; World Health Organization Regional Office for the Eastern Mediterranean, 2016), culturally congruent dietary education strategies and interventions targeting Muslim populations are warranted. A diet that closely aligns with plant-based foods mentioned in the Holy Quran can be regarded as part of a healthy dietary pattern comparable to the MD. The promotion of plant-based foods such as dates, grapes, figs, olives, olive oil, pomegranates, and whole grains cited in the Holy Quran can serve as an influential culturally-relevant environment-friendly diet model. Culturally competent dietitians, anthropologists, nurses, public health educators, clinicians, and other health professions operating in predominately Muslim communities should acquaint themselves with passages from the Holy Quran that cite plant-based foods for the purpose of promoting healthy dietary patterns. Though recent studies (Aboul-Enein, 2015, 2016; Azarpour et al., 2014; Ghadimi et al., 2013; Tarighat-Esfanjani & Namazi, 2016) have begun exploring Islamic ethos and Quranic epistemology as it relates to public health nutrition, its application to practice remains largely unexplored. Consequently, future research directions should focus on incorporating and evaluating the Holy Quran’s applicability and efficacy in the form of interventions for behavioral health promotion and public health nutrition education as well as cultural competency training for public health professionals and medical anthropologists. From a theoretical perspective, faith-based health approaches could provide significant insight into the structuring of healthy dietary patterns and the possibilities for individuals to respond to faith-based health-promoting practices. Applications of the Holy Quran’s potential in addressing public health nutrition priorities and global health complexities could help broaden our perspectives to new and contemporary ways of thinking.

Limitations

Some limitations should be mentioned with regards to this narrative review. Although the author reviewed two formats of the Holy Quran, some verses may have been missed. Additionally, given that the English language was the language by which the Holy Quran was translated for the purpose of this review, Quranic citations may have been misinterpreted due to semantics, grammar, or syntax in the translation of Quranic chapters and their respective verses. It is important to note that this narrative study did not include the Sunnah and Hadith (manners, traditions, sayings, and deeds of the Islamic Prophet Muhammed) and was intended mainly to present an interpretational overview of plant foods cited the Holy Quran and its potential implications for human health and nutrition applicable to Muslim populations.
