# Synthesis and evaluation of novel 2,4disubstituted arylthiazoles against $T$. bruce $i \dagger$ 

Markos-Orestis Georgiadis, (D) ${ }^{\text {a }}$ Violeta Kourbeli, (i) ${ }^{a}$ Ioannis P. Papanastasiou, (D)*a Andrew Tsotinis, (1) ${ }^{\text {a }}$ Martin C. Taylor (i) ${ }^{\text {b }}$ and John M. Kelly ${ }^{\text {b }}$

#### Abstract

The design, synthesis and pharmacological evaluation of the 4-substituted-2-[3-(adamant-1-yl)-4fluorophenyl]thiazoles 1a-j, the 4-substituted-2-[4-(adamant-1-yl)phenyl]thiazoles 2a-h, the 2 -substituted-4-[4-(adamant-1-yl)phenyl]thiazoles $3 \mathrm{a}-\mathrm{e}$, the $N$-substituted 2-phenylthiazol-4-ethylamides $4 \mathrm{a}, \mathrm{b}$ and the N -substituted 4-phenylthiazol-2-ethylamides 4c, d is described. Compounds 1 a and 2 a exhibit trypanocidal activity in the range of $\mathrm{IC}_{50}=0.42 \mu \mathrm{M}$ and $\mathrm{IC}_{50}=0.80 \mu \mathrm{M}$, respectively. Both of these derivatives bear a lipophilic end, which consists of a 4-(1-adamantyl) phenyl or a 3-(1-adamantyl)phenyl moiety, a 1,3-thiazole ring and a functional end, which comprises of an alkylamine and can be considered as promising candidates for the treatment of Trypanosoma brucei infections.

## Introduction

The African sleeping sickness and the Chagas disease are two of the major neglected tropical diseases (NTDs). The trypanosomiases are vector-borne parasitic infections caused by flagellated protozoa of the class Kinetoplastida. ${ }^{1}$ There are two species of human-infectious trypanosomes, Trypanosoma brucei, that causes human African trypanosomiasis (HAT), and Trypanosoma cruzi, which is responsible for the Chagas disease. HAT is prevalent in sub-Saharan Africa, transmitted by the bite of a tsetse fly infected with one of the two subspecies, Trypanosoma brucei gambiense or Trypanosoma brucei rhodesiense. The Chagas disease is spread predominantly in Latin and Central America by Triatominae bugs infected with T. cruzi. ${ }^{2,3}$ Trypanosomiases, as with other NTDs, are becoming public health problems in non-endemic countries, as a result of travel and migration. New drugs are urgently required, as those that are currently available are characterized by sideeffects and treatment failures. ${ }^{4,5}$

Various initiatives ${ }^{6-8}$ have led to the discovery of promiscuous trypanocidal derivatives from phenotypic highthroughput screening of a number of compound libraries. These have been further refined and optimized to enhance drug-like properties. The Walter and Eliza Hall Institute (WEHI), in partnership with the Drugs for Neglected Diseases initiative (DND $i$ ), and the Genomics Institute of the Novartis

[^0]Research Foundation (GNF) have described the amide and urea derivatives of thiazolethylamines I, II and sulfonamides III, shown in Fig. 1, as potent trypanocidals. ${ }^{6,7}$

Based on these findings and our involvement in the adamantane chemistry, ${ }^{9-20}$ we report herein on the chemistry and biology of thiazole derivatives of the general type scaffold IV. The thiazole moiety is an important pharmacophore in many compounds used against several tropical infectious diseases. ${ }^{21}$

Scaffold IV includes a 1,3 -thiazole moiety, which is $2,4-$ disubstituted. One substituent is the lipophilic end of the scaffold, which consists of a phenyl ring bearing fluoro- and 1-adamantyl-functionalities. The 4-(1-adamantyl)phenyl substituent has been proven to be well tolerated and is endowed with trypanocidal properties. ${ }^{22}$ The thiazole ring bears a variety of functional groups (Fig. 2).

2-Phenylthiazol-4-ethylamines 1a-d and 2a-d share the same structural features, apart from the relative position of the 1-adamantyl core and the addition of a fluoro-substituent in series 1. Fluorine alters the biophysical and chemical properties, such as lipophilicity, acidity, as well as the reactivity

Fig. 1 General type scaffolds with trypanocidal activity.

Fig. 2 Novel thiazole derivatives 1a-j, 2a-h, 3a-e, 4a-d.
and conformation of the substituted derivatives. ${ }^{23}$ In 2018, 18 out of the 38 small drug molecules, that were approved by the FDA, contain a fluorine atom. ${ }^{24,25}$ Derivatives 3 differ in the thiazole moiety compared to adducts 1 and 2 . The 2,4substituents of the thiazoles $2 \mathbf{a}$, $\mathbf{c}$ have their positions switched in derivatives $3 \mathbf{c}$, $\mathbf{d}$. The functionalization of the amino-end of congeners $\mathbf{1}$ involves various amide (aromatic and non-aromatic) and urea substituents. In adducts 2 , the polar heads were translocated to the functional end of the general type scaffold $\mathbf{I V}$. The length of the side chain of derivatives $2 \mathbf{e}, 2 \mathbf{g}$ and $3 \mathbf{e}$ was kept at the distance of three atoms ( 2 C and 1 N and vice versa), which in the derivatives I, II and III was found to be the optimal length for enhanced trypanocidal potency. ${ }^{6-8}$ The length of the R group is different in adducts $2 \mathbf{f}, \mathbf{h}$ and $\mathbf{3 a}, \mathbf{b}$. 2-Aminothiazole (adduct 3a), is a frequent-hitting fragment in biophysical binding assays. ${ }^{26}$ Moreover, an analogous thiazole guanidinium system of derivative 3 e has been used as a substitute for other aromatic rings improving biological activity. ${ }^{27}$

The relative position of the adamantane cage, the phenyl ring and the thiazole moiety was altered in derivatives $\mathbf{4 a}, \mathbf{c}$.

Compounds 4a, $\mathbf{c}$ bear the same thiazole ring substituents as derivatives 2 and 3. Additionally, the adamantane core was replaced in the camphor skeleton in adducts $\mathbf{4 b}, \mathbf{4}$. The latter molecules are sulfonamides in alignment with the scaffolds of compounds III. ${ }^{7}$

## Results and discussion

## Synthesis

The 4 -substituted-2[3-(adamant-1-yl)-4-fluorophenyl]thiazoles 1a-j were synthesized as shown in Scheme 1. As starting material, for the synthesis of thiazoles $\mathbf{1 a - j}$, the (3-adamant-1-yl)-(4fluorophenyl)boronic acid (6) was used. The reported method for the preparation of the boronic acid 6 (ref. 28) has been modified, by changing the reaction times. The synthetic route involved a Suzuki-Miyaura palladium-catalyzed coupling between the boronic acid 6 and the 2-thiazole bromide 7 (ref. 6) to provide the phthalimide protected adamantane derivative 8. The hydrazinolysis of phthalimide derivative 8 led to the deprotected parent compound $2-\{2$-[3-(adamant-1-yl)-4-fluorophenyl]thiazol4 -yl\}ethan-1-amine (1a), which was subsequently methylated, dimethylated, ${ }^{29}$ acylated and carbamoylated to deliver adducts $\mathbf{1 b}-\mathbf{j}$, via the procedures shown in Scheme 1.

The synthesis of the 4 -substituted-2[4-(adamant-1yl)phenyl]thiazoles 2a-d was realized following two synthetic pathways, as illustrated in Scheme 2. The key-compound for the preparation of the thiazoles $\mathbf{2 a}-\mathbf{h}$, the $2-\{2-[(2$-(adamant-1-yl)phenyl)thiazol-4-yl]ethyl\}isoindoline-1,3-dione (10) was obtained via two different synthetic routes. The first involves a Suzuki-Miyaura ${ }^{30}$ palladium-catalysed coupling between the 4,4,5,5-tetramethyl-2-[4-(adamant-1-yl)phenyl]-2H-1,3,2-dioxaborolane $(9)^{31}$ and the 2 -thiazole bromide 7 , which led to the protected precursor 10. The second synthetic approach, towards the thiazole adduct 10, was based on the Hantzsch condensation ${ }^{32}$ of thiobenzamide 14 with the $\alpha$-bromoketone 15. ${ }^{6}$ Our lab has previously published the preparation of the 4 -(adamant-1-yl)benzoic acid (12), ${ }^{31}$ which was now obtained by a different transition metal ion catalyzed oxidation of 1-(4-tolyl)adamantane (11). ${ }^{33}$ The reported method of oxidation ${ }^{34}$ was modified as the reaction mixture was bubbled with oxygen gas and heated at $105{ }^{\circ} \mathrm{C}$ for 6 h . The benzoic acid 12 was subsequently converted to the corresponding benzamide 13 and the thiobenzamide 14. Comparing the two methods, the first involves 5 steps ( $17 \%$ total yield), while the second 6 steps ( $25 \%$ total yield), a more facile work-up and cheaper

reagents. The parent thiazole 2 a was methylated, dimethylated and acetylated to the respective congeners $\mathbf{2 b} \mathbf{b} \mathbf{d}$, as previously shown.

The functionalized thiazoles $2 \mathbf{e}-\mathbf{h}$ were obtained by the route shown in Scheme 3. The thiobenzamide 14 was condensed with 1,3-dichloroacetone and 4-chloroacetoacetate, under Hantzsch reaction conditions, to give the chloromethylthiazole 15 and the thiazolethyl acetate 16, respectively. Treatment of the choromethylthiazole 15 with KCN or KSCN led to the respective cyanide $2 \mathbf{e}$ and the thiocyanide $2 \mathbf{f}$. The thiazolethyl acetate $\mathbf{1 6}$ was reduced to the corresponding alcohol $2 \mathbf{g}$, which was then converted to the azide $2 \mathbf{h}$, via activation of the methanesulphonyl derivative 17.

The synthesis of the 2 -substituted-4-\{4-(adamant-1yl)phenylfthiazoles $\mathbf{3 a - d}$ and the guanidyl derivative $\mathbf{3 e}$, is shown in Scheme 4. (1-Phenyl)adamantane (18) ${ }^{4}$ was acylated under Friedel-Crafts reaction conditions ${ }^{36}$ to deliver the corresponding $\alpha$-bromoketone 19, which via a Hantzsch condensation with the appropriate reagent, thiourea, ${ }^{37}$ thioamides $20,{ }^{38} 21$ (ref. 7) and guanylthiourea provided the desired thiazoles $3 \mathbf{a}-\mathbf{c}$ and $3 \mathbf{e}$, respectively. The dimethylthiazole $\mathbf{3 d}$ was prepared from the parent thiazole $3 \mathbf{c}$, as shown before.

The 1-adamantylcarbonylamides $\mathbf{4 a}$, $\mathbf{c}$ and the $( \pm)-10$ camphorsulfonyl amides $\mathbf{4 b}$, $\mathbf{d}$ were obtained upon coupling the commercially available 1-adamantylcarboxylic acid and ( $\pm$ )-10-camphorsulfonyl chloride with the 2-phenylthiazol-4ethylamine (22) ${ }^{6}$ and the 4-phenylthiazol-2-ethylamine (23), ${ }^{7}$ respectively. The acid reacted in the presence of the coupling reagent HBTU, while the chlorides reacted without the aid of any activating reagent (Scheme 5).

## Pharmacology

The 27 new thiazole derivatives were tested for their activity against the bloodstream form Trypanosoma brucei and the results are shown in Table 1.

It is apparent from the test results that the ethylamines 1a-c exhibit the highest activity among the new 2,4disubstituted arylthiazoles. Bulkier substituents than the methyl group at the amino end have a negative impact on trypanocidal activity. Amido adducts (alkyl 1d and 1c, the aromatic $\mathbf{1 f}$ and $\mathbf{1 g}$ and the heteroaromatic $\mathbf{1 h}$ ) and the ureido derivatives, $\mathbf{1 i}$ and $\mathbf{1 j}$, have a non-significant activity. The same pattern is also observed in the 2 series, as compounds

DMF, $60^{\circ} \mathrm{C}, 2 \mathrm{~h}, 65 \%$.

Scheme 4 Reagents and conditions: (a) $\mathrm{BrCOCH}_{2} \mathrm{Br}, \mathrm{AlCl}_{3}, \mathrm{DCM},-10{ }^{\circ} \mathrm{C}$ then r.t. $18 \mathrm{~h}, 57 \%$; (b) appropriate thiobenzamide 20 ( 3 b : $36 \%$ ), 21 ( 3 c : $85 \%$ ), i- PrOH , autoclave, $120^{\circ} \mathrm{C} 18 \mathrm{~h}$ or thiourea (3a: $88 \%$ ), EtOH , reflux, 18 h ; (c) $\mathrm{MeONa}, \mathrm{CH}_{3} \mathrm{COOH}, \mathrm{HCHO} 38 \%$ in $\mathrm{H}_{2} \mathrm{O}, \mathrm{NaBH} \mathrm{CN}^{2}, \mathrm{MeOH}, \mathrm{r} . \mathrm{t} .18$ h, 85\%; (d) guanylthiourea, EtOH, reflux, 18 h, 89\%.

2a-c are $c a .20$ times more active than their acetamido congener 2d. Comparing series $\mathbf{1}$ and 2, it becomes apparent that the fluorine substitution has little positive effect on the activity. The dimethylamino isomeric thiazoles $2 \mathbf{c}$ and $3 \mathbf{d}$ present almost the same potency, while the nor-derivatives, the isomeric thiazoles $2 \mathbf{a}$ and 3c, show a substantial difference in potency. The 2-phenylthiazol-4-ethylamines 1a, cand 2a, c seem to be, in general, more potent than their isomeric 4 -phenylthiazol-2-ethylamines $3 \mathbf{c}$ and 3d. The decrease of the length of the side chain does not enhance activity. Methanamine 3b bears two atoms (carbon and nitrogen) in its side chain and is twice as potent as the 2 -aminothiazole 3a, which has only one nitrogen atom. The polar functionalization of the side chain did not improve the trypanocidal activity. The azido and cyano-tailored derivatives $2 \mathbf{e}$ and $2 \mathbf{h}$ are less potent, and the thiocyanate $2 \mathbf{f}$, the ethanol 2 g and the guanyl derivative 3 e exhibit modest activity. The change in the relative position of the adamantane cage, the phenyl ring and the thiazole moiety, in adducts $\mathbf{4 a}$ and $\mathbf{4 c}$, did not lead to activity enhancement. Last, the replacement of the adamantane skeleton by the camphorsulfonyl moiety in derivatives $\mathbf{4 b}$ and $\mathbf{4 d}$ has not led to antitrypanosomal enhancement. The 2,4-disubstituted arylthiazole adamantane derivatives, the ethylamines $\mathbf{1 a - c}$ and $\mathbf{2 a - c}$, present a notable pharmacological profile, which merits further investigation in terms of activity and toxicity. These findings suggest that an aliphatic amine moiety at the side chain is mandatory to achieve notable trypanocidal activity. This amine group is positively charged at the cytosolic pH , which is not the case for all the other polar heads tested. The presence of this particular group might also enhance the cellular accumulation into the protozoa, as it is reported in the case of bacteria. ${ }^{39,40}$ Thus, the ethylamines $\mathbf{1 a - c}$ and $\mathbf{2 a - c}$ seem to exhibit promis-

Scheme 5 Reagents and conditions: (a) appropriate chloride $\mathrm{NEt}_{3}$, DCM or THF, r.t. 18 h, (4a: 49\%, 4b: 50\%, 4d: 81\%); (b) 1-adamantanecarboxylic acid HBTU, DIPEA, DCM/DMF, r.t. 24 h, $94 \%$.
ing trypanocidal properties, although further optimisation will be necessary to reduce their cytotoxicity and to develop a more drug-like profile.

## Conclusions

In this work, we describe the synthesis of a new series of aromatic 2,4-disubstituted 1,3-thiazole analogues with trypanocidal potency. Among their congeners, the 2-phenylthiazol-4-ethylamines $\mathbf{1 a - c}$ and $2 \mathrm{a}-\mathbf{c}$ presented the most significant trypanocidal activity against T. brucei. Analogues $\mathbf{1 a}$ and $2 \mathbf{2 a}$ exhibit antitrypanosomal activity in the range of $\mathrm{IC}_{50}=0.42 \mu \mathrm{M}$ and $\mathrm{IC}_{50}=0.80 \mu \mathrm{M}$, respectively. Primary amine $2 \mathbf{a}$ is less potent than its congener $\mathbf{1 a}$, but exhibits higher selectivity, which is a promising perspective for designing new trypanocidals in the future. Both of these classes of derivatives bear a lipophilic end, which consists of a 4-(1-adamantyl)phenyl or a 3-(1-adamantyl)phenyl moiety, a 1,3-thiazole ring and a functional end, which comprises of an alkylamine. The addition of the adamantane ring into the scaffold of the thiazole reference compounds ${ }^{6,7}$ has not improved their pharmacological profile, in terms of activity and toxicity. On the other hand, the new congeners exhibit promising trypanocidal properties that merit further investigation. These tailored-made structural modifications will be implemented in the future in the design of trypanocidal agents.

## Experimental part

## Biology

Cytotoxic activity against rat skeletal myoblast L6 cells. Cytotoxicity against mammalian cells was assessed using microtitre plates. Briefly, L6 cells (a rat skeletal muscle line) were seeded at $1 \times 10^{4} \mathrm{~mL}^{-1}$ in $200 \mu \mathrm{~L}$ of growth medium containing 7 different compound concentrations in a range previously established to encompass both the $\mathrm{IC}_{50}$ and $\mathrm{IC}_{90}$ values. The plates were incubated for 6 days at $37^{\circ} \mathrm{C}$ and 20 $\mu \mathrm{L}$ Alamar Blue (Biosource UK Ltd) was then added to each well. After an additional 8 hours incubation, the fluorescence was determined using a FLUOstar Omega fluorescent plate reader (BMG Labtech). Inhibition of growth was calculated by comparison with control values and $\mathrm{IC}_{50}$ and $\mathrm{IC}_{90}$ values were determined in triplicate using linear regression analysis.

${ }^{a} \mathrm{IC}_{50}$ and $\mathrm{IC}_{90}$; concentration that inhibits growth by $50 \%$ and $90 \%$. ${ }^{b}$ S.I.; selectivity index, the ratio of $\mathrm{IC}_{50}$ values obtained with L 6 cells and T. brucei respectively.

Trypanosoma brucei culturing and drug testing. Bloodstream form T. brucei (strain 427) were cultured at $37^{\circ} \mathrm{C}$ in modified Iscove's medium. Trypanocidal activity was assessed by growing parasites in microtiter plates in the presence of various drug concentrations. Parasites were seeded at $0.25 \times$ $10^{5} \mathrm{~mL}^{-1}$ in $200 \mu \mathrm{~L}$ of growth medium containing 7 different compound concentrations in a range previously established to encompass both the $\mathrm{IC}_{50}$ and $\mathrm{IC}_{90}$ values. The plates were incubated for 48 hours at $37^{\circ} \mathrm{C}$ and $20 \mu \mathrm{~L}$ Alamar Blue was then added to each well. After an additional overnight incubation, the fluorescence was determined. Inhibition of growth was calculated by comparison with control values and $\mathrm{IC}_{50}$ and $\mathrm{IC}_{90}$ values were determined in triplicate using linear regression analysis.

Synthetic procedures. All chemicals and solvents were obtained from commercial suppliers and used without further purification. Reactions were monitored by thin layer chromatography. Melting points were determined on a Büchi 530 apparatus and are uncorrected. Infrared (IR) spectra were recorded on a Perkin-Elmer 833 spectrophotometer. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra recorded on a Bruker DRX $400(400 \mathrm{MHz})$ spectrometer and ${ }^{13} \mathrm{C}$-NMR spectra were taken at 50 MHz on Bruker AC $200(200 \mathrm{MHz})$ spectrometer and at 150 MHz on Bruker Avance 600 spectrometer ( 600 MHz ). All NMR spectra were taken in deuterochloroform or hexadeuterodimethyl sulfoxide and the chemical shifts are reported in ppm. Elemental analyses ( $\mathrm{C}, \mathrm{H}, \mathrm{N}$ ) were carried out by the Institute of Chemical

Biology, NHRF, Greece and the results obtained had a maximum deviation of $\pm 0.4 \%$ from the theoretical value.

3-\{(1-Tricyclo[3.3.1.1 ${ }^{3,7}$ ]decyl)-4-fluorophenyl\}boronic acid (6). $n$-BuLi ( $4 \mathrm{~mL}, 1.6 \mathrm{M}$ in hexanes, 6.4 mmol ) was added in one portion to a stirred solution of the bromide 5 (ref. 28) ( $1.25 \mathrm{~g}, 4.04 \mathrm{mmol}$ ) in anhydrous THF ( 20 mL ), at $-73^{\circ} \mathrm{C}$, under an argon atmosphere. The mixture was then stirred at $-80^{\circ} \mathrm{C}$ for 25 min prior to addition of (i-PrO) $)_{3} \mathrm{~B}(3 \mathrm{~mL}, 12.1$ mmol ). The reaction mixture was stirred for 35 min at the same temperature and subsequently at ambient temperature overnight. Next, dilute $\mathrm{HCl}(20 \mathrm{~mL})$ was added dropwise at $0^{\circ} \mathrm{C}$, the mixture was stirred for 30 min at room temperature and then extracted with EtOAc $(3 \times 20 \mathrm{~mL})$. The combined organic layers were washed with water, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent evaporated under reduced pressure. The residue was crystallized from $n$-hexane to give compound 6 ( 1.1 g , $90 \%$ ) as a white solid, which was used directly in the next step. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.18(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 1 \mathrm{H}$, $2-\mathrm{Har}), 8.03$ (dd, $J=8.4,4.2 \mathrm{~Hz}, 1 \mathrm{H}, 6-\mathrm{Har}), 7.12$ (dd, $J=8.1$, $7.8 \mathrm{~Hz}, 1 \mathrm{H}, 5-\mathrm{Har}$ ), 2.12 (bs, 3H, 3,5,7-Had), 2.06 (bs, 6H, 2,8,9-Had), 1.79 (br.s, 6H, 4,6,10-Had).

2-\{2-[2-((1-Tricyclo[3.3.1.1 ${ }^{3,7}$ ]decyl)-4-fluorophenyl)thiazol4 -yl]ethyl\}isoindoline-1,3-dione (8). Argon was bubbled for 20 min through a stirred mixture of boronic acid $6(250 \mathrm{mg}, 0.9$ mmol ), the 2-thiazole bromide 7 (ref. 6) ( $161 \mathrm{mg}, 0.45 \mathrm{mmol}$ ), toluene ( 5 mL ) and $\mathrm{Na}_{2} \mathrm{CO}_{3}(2 \mathrm{M}, 5 \mathrm{~mL})$. The reaction mixture was then heated to $80^{\circ} \mathrm{C}$, under an argon atmosphere,
$\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(107 \mathrm{mg})$ was added and heating was continued overnight. After cooling, the reaction mixture was extracted with EtOAc $(3 \times 25 \mathrm{~mL})$ and the combined organics were washed with water dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent removed in vacuo. The residue was purified by column chromatography. Elution with 10-20\% EtOAc in hexanes afforded compound 8 as a foamy solid ( $175 \mathrm{mg}, 80 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.85-7.79$ (m, 2H, 3', 4'-Har), 7.76 (dd, $J=7.7,2.2 \mathrm{~Hz}, 1 \mathrm{H}$, 2-Har), 7.73-7.68 (m, 2H, 2', 5'-Har), 7.64-7.58 (m, 1H, 6-Har), 6.71 (s, 1H, 5-Hth), 6.96 (dd, $J=12.7,8.3 \mathrm{~Hz}, 1 \mathrm{H}, 5-\mathrm{Har}), 4.11$ ( $\mathrm{t}, J=7.0 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2} N$ ), $3.23\left(\mathrm{t}, J=7.0 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right.$ ), 2.10 (br. s, 3H, 3,5,7-Had), 2.04 (bs, 6H, 2,8,9-Had), 1.79 (br.s, 6H, 4,6,10-Had). ${ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{DMSO}-d_{6}$ ) $\delta 167.2$ (C=O), 166.6 (2-Cth), 162.8 (d, $J=251.9 \mathrm{~Hz}, 4$-Car), 152.8 (4-Cth), 137.5 (d, $J=11.4 \mathrm{~Hz}, 3$-Car), 132.9 ( $1^{\prime}, 6^{\prime}$-Car), 132.8 ( $3^{\prime}, 4^{\prime}$-Car), 129.2 (1-Car), 126.2 (d, $J=8.4 \mathrm{~Hz}, 2$-Car), 125.1 (6-Car), 122.2 (2',5'-Car) 117.5 (d, $J=25.4,5-\mathrm{Car}), 116.4$ (5-Cth), 40.5 (2,8,9$\mathrm{Cad}), 38.4\left(\mathrm{NCH}_{2}\right), 36.2$ (1-Cad), 36.0 (4,6,10-Cad), $28.8\left(\mathrm{CH}_{2}\right)$, 28.2 (3,5,7-Cad). 2-[4-(1-Tricyclo[3.3.1.1 ${ }^{3,7}$ ]decyl)phenyl]-4-(chloromethyl)thiazole (15). Thiobenzamide $14(200 \mathrm{mg}, 0.74 \mathrm{mmol})$ was added to a stirred solution of 1-3-dichloroacetone ( 125 mg , $0.99 \mathrm{mmol})$ in acetone ( 4 mL ) and the reaction mixture was refluxed overnight. The solvent was removed in vacuo and the resulting residue was dissolved in conc. $\mathrm{H}_{2} \mathrm{SO}_{4}(5 \mathrm{~mL})$, stirred for 30 min and subsequently poured onto a mixture of water and ice. The resulting suspension was the filtered and the precipitate was washed with water to afford compound 15 as a yellow-white solid ( $190 \mathrm{mg}, 75 \%$ ), which was used in the next step without further purification.

2-\{2-[4-(1-Tricyclo[3.3.1.1 ${ }^{3,7}$ ]decyl)phenyl]thiazol-4-yl\}acetonitrile (2e). A solution of the chloride 15 ( $180 \mathrm{mg}, 0.52$ mmol ) and KCN ( $260 \mathrm{mg}, 5.24 \mathrm{mmol}$ ) in anhydrous DMF ( 2 mL ), was heated at $60^{\circ} \mathrm{C}$ under an argon atmosphere for 36 h and then chilled to room temperature. Water was then added into the reaction mixture, which was extracted with EtOAc. The organic layer was washed with water and brine, dried over $\mathrm{MgSO}_{4}$, and then the solvent was evaporated in vacuo. The solid residue was then purified by column chromatography. Elution with $20 \%$ EtOAc in hexanes afforded compound 2 e as a yellow crystalline solid ( $70 \mathrm{mg}, 41 \%$ ). M.p.: $159-160{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.86(\mathrm{~d}, J=8.5 \mathrm{~Hz}$, $2 \mathrm{H}, 2,6 \mathrm{H}-\mathrm{ar}$ ), 7.44 (d, $J=8.4 \mathrm{~Hz}, 2 \mathrm{H}, 3,5-\mathrm{Har}$ ), 7.26 (s, 1 H , $5-\mathrm{Hth}), 3.95$ (s, 2H, CH 2 ), 2.12 (s, 3H, 3,5,7-Had), 1.93 (d, $J=$ $2.1 \mathrm{~Hz}, 6 \mathrm{H}, 2,8,9-\mathrm{Had}$ ), 1.79 (q, 6H, 4,6,10-Had). ${ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 169.7$ (2-Cth), 154.2 (1-Car), 145.6 (4-Cth), 130.4 (4-Car), 126.4 ( $2,6-\mathrm{Car}$ ), 125.6 (3,5-Car), 116.9 (CN), 115.6 (5-Cth), 43.0 ( $2,8,9-\mathrm{Cad}$ ), 36.7 ( $4,6,10-\mathrm{Cad}), 36.5$ ( $1-\mathrm{Cad}$ ), 28.9 (3,5,7-Cad), $20.7\left(\mathrm{CH}_{2}\right)$. Anal. calcd for $\mathrm{C}_{21} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{~S}: \mathrm{C}$, 75.41; H, 6.63; N, 8.38 found C, 74.34; H, 6.29; N, 8.51.

2-[4-(1-Tricyclo[3.3.1.1 ${ }^{3,7}$ ]decyl)phenyl]-4-(thiocyanatemethyl)thiazole (2f). A solution of the chloride 15 (250 $\mathrm{mg}, 0.73 \mathrm{mmol}$ ) and KSCN ( $100 \mathrm{mg}, 1.34 \mathrm{mmol}$ ) in EtOH (4 ml ), was heated to $45{ }^{\circ} \mathrm{C}$ under an argon atmosphere overnight. The reaction mixture was then poured onto a mixture of ice and water and the resulting suspension was filtered. The residue obtained was crystallized from EtOH to afford compound 2 f as a white solid ( $250 \mathrm{mg}, 67 \%$ ). M.p.: 169-170 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(600 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.85(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}, 2,6 \mathrm{H}-$
ar), 7.41 (d, $J=8.4 \mathrm{~Hz}, 2 \mathrm{H}, 3,5-\mathrm{Har}), 7.23$ (s, 1H, $5-\mathrm{Hth}), 4.29$ (s, 2H, CH $), 2.09$ (s, 3H, 3,5,7-Had), 1.91 (d, 6H, 2,8,9-Had), 1.76 (q, 6H, 4,6,10-Had). ${ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 169.7$ (2-Cth), 154.2 (1-Car), 149.7 (4-Cth), 130.4 (4-Car), 126.5 (2,6Car), 125.6 (3,5-Car), 117.5 (5-Cth), 112.0 (SCN), 43.0 (2,8,9Cad ), 36.7 ( $4,6,10-\mathrm{Cad}), 36.50$ (1-Cad), $33.9\left(\mathrm{CH}_{2}\right), 28.9$ (3,5,7Cad). Anal. calcd for $\mathrm{C}_{21} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{~S}_{2}$ : C, 68.81; H, 6.05; $\mathrm{N}, 7.64$ found C, 68.81; H, 6.09; N, 7.59.

Ethyl 2-\{2-[4-(1-Tricyclo[3.3.1.1 ${ }^{3,7}$ ]decyl)phenyl]thiazol-4-yl\}acetate (16). 4-Chloroacetoacetate ( $700 \mathrm{mg}, 2.43 \mathrm{mmol}$ ) was added to a stirred mixture of thiobenzamide $14(1 \mathrm{~g}, 3.68$ $\mathrm{mmol})$ in $\mathrm{i}-\mathrm{PrOH}(8 \mathrm{~mL})$, and the reaction mixture was stirred overnight, at $110{ }^{\circ} \mathrm{C}$, in an autoclave. The solvent was then removed in vacuo and the resulting residue was dissolved in EtOAc and washed with water, a saturated aqueous solution of $\mathrm{NaHCO}_{3}$ and brine. The organic layer was then dried over $\mathrm{MgSO}_{4}$ and the solvent evaporated under vacuum. The resulting oil was triturated with EtOAc/hexanes to afford compound 16 as a light orange solid ( $1.3 \mathrm{~g}, 92 \%$ ) which was used in the next step without further purification.

2-\{2-[4-(1-Tricyclo[3.3.1.1 ${ }^{3,7}$ ]decyl)phenyl]thiazol-4-yl\}ethan-1-ol (2g). To a stirred suspension of $\mathrm{LiAlH}_{4}(85 \mathrm{mg}, 2.23$ mmol ) in anhydrous THF ( 5 mL ), was added dropwise a solution of compound 16 ( $170 \mathrm{mg}, 0.44 \mathrm{mmol}$ ) in anhydrous THF ( 3 mL ), under an argon atmosphere and then the reaction mixture was stirred at ambient temperature for 2 h . Next, the mixture was cooled in an ice bath and ethanol, water and a $\mathrm{NaOH}(10 \%)$ solution were added in order. The resulting suspension was then filtered, the filtrate was evaporated in vacuo and extracted with DCM. The organic layer was then washed with water, dried over $\mathrm{MgSO}_{4}$ and the solvent evaporated to afford compound 2 g as an off white solid ( $120 \mathrm{mg}, 80 \%$ ). M. p.: 93-94 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.86(\mathrm{~d}, J=8.4 \mathrm{~Hz}$, $2 \mathrm{H}, 2,6 \mathrm{H}-\mathrm{ar}$ ), 7.42 (d, $J=8.4 \mathrm{~Hz}, 2 \mathrm{H}, 3,5-\mathrm{Har}$ ), 6.94 (s, 1H, $5-\mathrm{Hth}), 3.99\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{OH}\right), 3.68(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH}), 3.02(\mathrm{t}, J=5.5$ $\mathrm{Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}$ ), 2.12 ( $\left.\mathrm{s}, 3 \mathrm{H} 3,5,7-\mathrm{Had}\right), 1.95(\mathrm{~d}, J=11.0 \mathrm{~Hz}, 6 \mathrm{H}$, 2,8,9-Had), 1.83-1.73 (m, 6H, 4,6,10-Had). ${ }^{13} \mathrm{C}$ NMR (150 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 168.5$ (2-Cth), 155.7 (4-Cth), 153.8 (1-Car), 130.7 (4-Car), 126.3 (2,6-Car), 125.5 (3,5-Car), 113.4 (5-Cth), $62.1\left(\mathrm{CH}_{2} \mathrm{OH}\right), 43.0$ ( $\left.2,8,9-\mathrm{Cad}\right), 36.7$ ( $\left.4,6,10-\mathrm{Cad}\right), 36.4$ (1-Cad), $33.8\left(\mathrm{CH}_{2}\right), 28.9(3,5,7-\mathrm{Cad})$. Anal. calcd for $\mathrm{C}_{21} \mathrm{H}_{25} \mathrm{NOS}: \mathrm{C}$, 74.30; H, 7.42; N, 4.13 found C, 74.53; H, 7.31; N, 3.95.

2-\{2-[4-(1-Tricyclo[3.3.1.1 $\left.{ }^{3,7}\right]$ decyl)phenyl]thiazol-4-yl)ethyl\}methanesulfonate (17). To a stirred solution of the alcohol 2 g ( $170 \mathrm{mg}, 0.50 \mathrm{mmol}$ ) and $\mathrm{Et}_{3} \mathrm{~N}(85 \mu \mathrm{~L})$ in $\mathrm{DCM}(2 \mathrm{~mL}), \mathrm{MsCl}$ $(50 \mu \mathrm{~L})$ was added dropwise at $0^{\circ} \mathrm{C}$. The reaction mixture was stirred at ambient temperature overnight. 1 M hydrochloride solution was added, into the reaction mixture, which was then extracted with EtOAc and the organic layer was dried over $\mathrm{MgSO}_{4}$ and the solvent evaporated to afford compound 17 as a yellow solid ( $170 \mathrm{mg}, 95 \%$ ), which used in the next step without further purification.

2-[4-(1-Tricyclo[3.3.1.1 ${ }^{3,7}$ ]decyl)phenyl]-4-(2-azidoethyl)thiazole (2h). To a stirred solution of the mesylate 17 (180 $\mathrm{mg}, 0.42 \mathrm{mmol}$ ) in anhydrous DMF ( 2 mL ), was added $\mathrm{NaN}_{3}(40 \mathrm{~mL})$ and the reaction mixture was heated at 60
${ }^{\circ} \mathrm{C}$, for 2 h . The reaction mixture was then extracted with EtOAc and the organic layer was dried over $\mathrm{MgSO}_{4}$ and evaporated in vacuo. The resulting residue was then purified by column chromatography. Elution with $20 \%$ EtOAc in hexanes afforded compound 2 h as a white solid (100 $\mathrm{mg}, 65 \%) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.87(\mathrm{~d}, J=8.6 \mathrm{~Hz}$, $2 \mathrm{H}, 2,6 \mathrm{H}-\mathrm{ar}$ ), 7.42 (d, $J=8.5 \mathrm{~Hz}, 2 \mathrm{H}, 3,5-\mathrm{Har}), 6.99$ (s, 1 H , $5-\mathrm{Hth}), 3.70\left(\mathrm{t}, J=6.9 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{~N}\right), 3.09(\mathrm{t}, J=7.1 \mathrm{~Hz}$, $2 \mathrm{H}, \mathrm{CH}_{2}$ ), 2.12 ( $\mathrm{s}, 3 \mathrm{H}, 3,5,7-\mathrm{Had}$ ), 1.93 (d, 6H, 2,8,9-Had), $1.85-1.71$ (m, 6H, 4,6,10-Had). ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 168.5 (2-Cth), 154.0 (4-Cth), 153.7 (1-Car) 131.1 (4-Car), 126.5 (2,6-Car), 125.6 (3,5-Car), 114.6 (5-Cth), 50.7 $\left(\mathrm{CH}_{2} \mathrm{~N}_{3}\right), 43.2$ (2,8,9-Cad), 36.9 ( $4,6,10-\mathrm{Cad}$ ), 36.6 ( $1-\mathrm{Cad}$ ), $31.5\left(\mathrm{CH}_{2}\right), 29.0$ (3,5,7-Cad). Anal. calcd for $\mathrm{C}_{21} \mathrm{H}_{24} \mathrm{~N}_{4} \mathrm{~S}: \mathrm{C}$, 69.20; H, 6.64; N, 15.37 found C, 69.08; H, 6.47; N, 14.99.

2-Bromo-1-[4-(1-Tricyclo[3.3.1.1 ${ }^{3,7}$ ]decyl)phenyl]ethanone (19). To a stirred solution of (1-phenyl)adamantane (18) ${ }^{35}$ ( $1.00 \mathrm{~g}, 4.71 \mathrm{mmol}$ ) and $\mathrm{AlCl}_{3}(700 \mathrm{mg}, 5.10 \mathrm{mmol})$ in anhydrous DCM $(10 \mathrm{~mL})$ was added a solution of $\mathrm{BrCOCH}_{2} \mathrm{Br}(0.5$ $\mathrm{mL}, 4.71 \mathrm{mmol})$ in anhydrous DCM ( 10 mL ) under an argon atmosphere, at $-10^{\circ} \mathrm{C}$. The reaction mixture was then heated to room temperature and stirred under an argon atmosphere overnight. Then the reaction mixture was poured onto ice-water, extracted with DCM and the organic layer was dried over $\mathrm{MgSO}_{4}$ and the solvent evaporated under vacuum. The resulting crude residue was purified by gradient column chromatography. Elution with EtOAc 3-5\% in hexanes afforded compound 19 as a white solid ( $900 \mathrm{mg}, 57 \%$ ). M.p.: $94-96{ }^{\circ} \mathrm{C}(\mathrm{EtOAc} / \mathrm{Hex}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.94(\mathrm{~d}, J$ $=8.6 \mathrm{~Hz}, 2 \mathrm{H}, 2,6-\mathrm{Har}), 7.48$ (d, $J=8.6 \mathrm{~Hz}, 2 \mathrm{H}, 3,5-\mathrm{Har}), 4.45$ (s, 2H, CH 2 ), 2.12 (s, 3H, 3,5,7-Had), 1.92 (d, $J=2.5 \mathrm{~Hz}, 6 \mathrm{H}$, 2,8,9-Had), 1.83-1.75 (br.s, 6H, 4,6,8-Had). ${ }^{13} \mathrm{C}$ NMR ( 75 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 191.0(\mathrm{C}=\mathrm{O}), 158.0$ (1-Car), 129.0 (2,6-Cad), 127.5 ( $4-\mathrm{Cad}$ ), 125.6 ( $3,5-\mathrm{Car}$ ), 42.9 ( $2,8,9-\mathrm{Cad}$ ), 36.9 ( $1-\mathrm{Cad}$ ), 36.8 (3,6,10-Cad), $31.1\left(\mathrm{CH}_{2}\right), 28.8$ (3,5,7-Cad). Anal. calcd for $\mathrm{C}_{18} \mathrm{H}_{21} \mathrm{BrO}: \mathrm{C}, 64.87$; H, 6.35 found C, 64.63; H, 6.46.

4-[4-(1-Tricyclo[3.3.1.1 ${ }^{3,7}$ ]decyl)phenyl]thiazol-2-amine hydrobromide (3a). A solution of the bromoketone 19 (130 $\mathrm{mg}, 0.39 \mathrm{mmol}$ ) and thiourea ( $30 \mathrm{mg}, 0.39 \mathrm{mmol}$ ) in EtOH ( 3 mL ) was heated at $80^{\circ} \mathrm{C}$, in an autoclave, overnight. The reaction mixture was then cooled to room temperature, treated with $\mathrm{Et}_{2} \mathrm{O}$ and the resulting precipitate was filtered to afford compound 3a hydrobromide as a white solid ( $150 \mathrm{mg}, 88 \%$ ). M.p. (hydrobromide): $345{ }^{\circ} \mathrm{C}$ (dec) (EtOH/Et ${ }_{2} \mathrm{O}$ ). ${ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $d_{6}$ ) $\delta 8.84$ (br.s, $3 \mathrm{H}, \mathrm{NH}_{3}$ ), $7.66(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}$, 2,6-Har), 7.47 (d, $J=8.5 \mathrm{~Hz}, 2 \mathrm{H}, 3,5-\mathrm{Har}), 7.18$ (d, $J=5.1 \mathrm{~Hz}$, $1 \mathrm{H}, 5-\mathrm{Hth}), 2.07$ (d, $J=8.1 \mathrm{~Hz}, 3 \mathrm{H}, 3,5,7-\mathrm{Had}), 1.87$ (br.s, 6 H , 2,8,9-Had), 1.74 (s, 6H, 4,6,10-Had). ${ }^{13} \mathrm{C}$ NMR ( 150 MHz , DMSO-d ${ }_{6}$ ) $\delta 170.1$ (4-Cth), 152.2 (2-Cth), 127.2 (1-Car), 125.7 (4-Car), 125.6 ( $2.6-\mathrm{Car}$ ), 125.3 (3,5-Car), 101.9 ( 5 -Cth), 42.3 ( $2,8,9-\mathrm{Cad}$ ), 36.1 ( $4,6,10-\mathrm{Cad}$ ), 35.9 ( $1-\mathrm{Cad}$ ), 28.2 ( $3,5,7-\mathrm{Cad}$ ). Anal. calcd for $\mathrm{C}_{19} \mathrm{H}_{22} \mathrm{BrN}_{2} \mathrm{~S}$ : C, 58.31; H, 5.92; N, 7.16 found C, 58.12 ; H, 5.85 ; N, 6.98 .

2-\{4-[4-(1-Tricyclo[3.3.1.1 ${ }^{3,7}$ ]decyl)phenyl]thiazol-2-yl\}methanamine difumarate (3b). A solution of the bromoketone 19 ( $1.10 \mathrm{~g}, 3.30 \mathrm{mmol}$ ) and amide 20 (ref. 38) ( 750 mg ,
$3.60 \mathrm{mmol})$ in i-PrOH ( 12 mL ) was heated at $120^{\circ} \mathrm{C}$, in an autoclave, overnight. The reaction mixture was then cooled to room temperature, treated with $\mathrm{Et}_{2} \mathrm{O}$ and the resulting precipitate was filtered to afford compound $\mathbf{3 b}$ ( $480 \mathrm{mg}, 36 \%$ ). M.p. (difumarate): $172{ }^{\circ} \mathrm{C}$ (dec) ( $\mathrm{EtOH} / \mathrm{Et}_{2} \mathrm{O}$ ). ${ }^{1} \mathrm{H}$ NMR (400 MHz, DMSO- $d_{6}$ ) $\delta 8.02(\mathrm{~s}, 1 \mathrm{H}, 5-\mathrm{Hth}), 7.90(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}$, 2,6-Har), 7.42 (d, $J=8.5 \mathrm{~Hz}, 2 \mathrm{H}, 3,5-\mathrm{Har}), 6.57$ (s, 4H, Hfum), 4.33 (s, 2H, CH ${ }_{2}$ ), $2.06(\mathrm{~s}, 3 \mathrm{H}, 3,5,7-\mathrm{Had}), 1.88(\mathrm{~d}, J=2.2 \mathrm{~Hz}$, $6 \mathrm{H}, 2,8,9-\mathrm{Had}$ ), 1.74 (s, 6H, 4,6,10-Had). ${ }^{13} \mathrm{C}$ NMR ( 75 MHz , DMSO- $d_{6}$ ) $\delta 167.7$ (2-Cth), 166.8 (C=O, fum), 151.0 (4-Cth), 134.5 ( $\mathrm{CH}_{2}$ fum), 131.4 (1-Car), 127.1 ( 4 -Car), 125.9 (2,6-Car), 125.2 (3,5-Car), 114.5 (5-Cth), 42.6 (2,8,9-Cad), $40.8\left(\mathrm{CH}_{2} \mathrm{~N}\right)$, 36.3 (4,6,10-Cad), 35.8 (1-Cad), 28.4 (3,5,7-Cad).
