4Hôpital Cantonal Universitaire de Lyon de Genève, Geneva, Switzerland.

In week 4/2005 of the 2004–2005 influenza surveillance season, clinical influenza activity was at medium intensity in eight participating countries (Austria, England, France, Italy, Luxembourg, Portugal, Spain and Switzerland) and low in 16 other countries. Increasing clinical activity (compared with the previous week) was reported in 15 countries; the most notable rises
Colour-coding scheme to classify publishers according to their self-archiving policy and to show the copyright and open access self-archiving policies of academic journals. Eurosurveillance is listed there as a ‘green’ journal, which means that authors can archive pre-print (i.e. pre-refereeing), post-print (i.e. final draft post-refereeing) and archive the publisher’s version/PDF.

**EXPRESSION OF CONCERN**

First results for week 5 in 2005 indicate a further increase in influenza activity in western central Europe (Switzerland, Slovenia, Austria, France, and Italy), which now also seems to be affecting the northern neighbouring countries of Belgium, Germany and the Netherlands. The initial decrease reported by Portugal in week 4, has reverted to an increase in influenza activity in week 5. Influenza activity in Europe is dominated by the A(H3) virus and most of these are A/Wellington/1/2004 (H3N2)-like viruses.

The total number of respiratory specimens collected by sentinel physicians was 1296: 23% tested positive for influenza virus. In addition, 213 non-sentinel specimens were influenza virus positive, bringing the total number of sentinel and non-sentinel positive specimens to 507. Of the 507 positive specimens, 468 were influenza A and 39 were influenza B. A total of 177 influenza A viruses were subtyped, 154 were A(H3) (of which 67 were A(H3N2)), 23 were A(H1) [of which 12 were A(H1N1) and three were A(H1N2)].

Based on (sub)typing data of all influenza virus detections up to week 04/2005 of the 2004-2005 influenza surveillance season \( n=3107 \); sentinel and non-sentinel data), 1671 (54%) were A (not subtyped), 1081 (35%) were A(H3) of which 331 were further subtyped as A(H3N2), 135 (4%) were A(H1) [68 further subtyped as A(H1N1) and three as A(H1N2)] and 220 (7%) were B. A total of 416 viruses (13% of all isolates) have been antigenically and/or genetically characterised: 258 A/Wellington/1/2004 (H3N2)-like viruses, 93 A/New Caledonia/20/99 (H1N1)-like viruses, seven A/Fujian/411/2002 (H3N2)-like viruses, two A/Panama/2007/99 (H3N2)-like viruses, 43 B/Jiangsu/10/2003-like viruses and 13 B/Hong Kong/330/2001-like viruses.

During the winter season (end of October to beginning of April) each year, the European Influenza Surveillance Scheme (EISS) monitors the spread of influenza virus strains and their epidemiological impact in Europe. It publishes a Weekly Electronic Bulletin which reports and effectiveness method development and assessment of a population-based cohort in Stockholm County, Sweden, seasons 2011/12 to 2014/15

Trivalent inactivated influenza vaccine effective against influenza A(H3N2) variant viruses in children during the 2014/15 season, Japan
comments on influenza activity in the 23 European EISS member countries (26 networks) (http://www.eiss.org) in collaboration with the World Health Organization Collaborating Centre for Reference and Research on Influenza in London.
